## ON THE CONTINUOUS DEPENDENCE OF SOLUTIONS TO ORTHOGONAL ADDITIVITY PROBLEM ON GIVEN FUNCTIONS

## KAROL BARON

**Abstract.** We show that the solution to the orthogonal additivity problem in real inner product spaces depends continuously on the given function and provide an application of this fact.

Let E be a real inner product space of dimension at least 2.

A function f mapping E into an abelian group is called orthogonally additive, if

f(x+y) = f(x) + f(y) for all  $x, y \in E$  with  $x \perp y$ .

It is well known, see [3, Corollary 10] and [1, Theorem 1], that every orthogonally additive function f defined on E has the form

(1) 
$$f(x) = a(||x||^2) + b(x) \text{ for } x \in E,$$

where a and b are additive functions uniquely determined by f. Consequently, given an abelian group G we have an operator  $\Lambda$  which to any orthogonally

Key words and phrases: orthogonal additivity, inner product space, continuous dependence on the given function, topological group, Tychonoff topology, nowhere dense set.

additive  $f: E \to G$  assigns a pair (a, b) of additive functions such that (1) holds, i.e.,

(2) 
$$\Lambda f = (a, b)$$

where

(3) 
$$a: \mathbb{R} \to G, \quad b: E \to G \quad \text{are additive and (1) holds}$$

Putting

$$\operatorname{Hom}_{\perp}(E,G) = \{f \colon E \to G \mid f \text{ is orthogonally additive}\}$$

and

$$Hom(S,G) = \{f \colon S \to G \mid f \text{ is additive}\}\$$

for  $S \in \{\mathbb{R}, E\}$  we see that  $\Lambda: \operatorname{Hom}_{\perp}(E, G) \to \operatorname{Hom}(\mathbb{R}, G) \times \operatorname{Hom}(E, G)$  given by (2) and (3) is an additive bijection.

To consider its continuity assume that G is a topological group and given a non-empty set S consider  $G^S$  of all functions from S into G with the usual addition and with the Tychonoff topology; clearly  $G^S$  is a topological group. In what follows we consider  $\operatorname{Hom}_{\perp}(E, G)$  and  $\operatorname{Hom}(S, G)$  for  $S \in \{\mathbb{R}, E\}$  with the topology induced by  $G^E$  and  $G^S$ , respectively.

The main result of this note reads.

THEOREM 1. Isomorphism  $\Lambda \colon \operatorname{Hom}_{\perp}(E,G) \to \operatorname{Hom}(\mathbb{R},G) \times \operatorname{Hom}(E,G)$ given by (2) and (3) is a homeomorphism.

PROOF. To show that  $\Lambda$  is continuous at zero fix neighbourhoods  $\mathcal{V} \subset$  Hom $(\mathbb{R}, G)$  and  $\mathcal{W} \subset$  Hom(E, G) of zeros. We may assume

$$\mathcal{V} = \{ a \in \operatorname{Hom}(\mathbb{R}, G) : a(\alpha_n) \in U \text{ for } n \in \{1, \dots, N\} \}$$

and

$$\mathcal{W} = \{ b \in \operatorname{Hom}(E, G) : b(x_n) \in U \text{ for } n \in \{1, \dots, N\} \}$$

with a neighbourhood U of zero in G and some  $\alpha_1, \ldots, \alpha_N \in \mathbb{R}, x_1, \ldots, x_N \in E, N \in \mathbb{N}$ . Choose a symmetric neighbourhood  $U_0$  of zero in G such that  $U_0 + U_0 \subset U$  and  $x_{N+1}, \ldots, x_{2N} \in E$  with

$$2||x_{N+n}||^2 = |\alpha_n|$$
 for  $n \in \{1, \dots, N\}$ 

and put

$$\mathcal{U} = \bigcap_{n=1}^{N} \{ f \in \operatorname{Hom}_{\perp}(E,G) : f(\frac{1}{2}x_n) \in U_0 \text{ and } f(-\frac{1}{2}x_n) \in U_0 \}$$
$$\cap \bigcap_{n=N+1}^{2N} \{ f \in \operatorname{Hom}_{\perp}(E,G) : f(x_n) \in U_0 \text{ and } f(-x_n) \in U_0 \}$$

Clearly  $\mathcal{U}$  is a neighbourhood of zero in  $\operatorname{Hom}_{\perp}(E, G)$  and to show that  $\Lambda(\mathcal{U}) \subset \mathcal{V} \times \mathcal{W}$  fix an  $f \in \mathcal{U}$ . Then we have (2) and (3) and, by (3),

$$b(x_n) = 2b(\frac{1}{2}x_n) = f(\frac{1}{2}x_n) - f(-\frac{1}{2}x_n) \in U_0 + U_0 \subset U_0$$

for  $n \in \{1, \ldots, N\}$ , whence  $b \in \mathcal{W}$ , and

$$a(\alpha_n) \in \{a(|\alpha_n|), -a(|\alpha_n|)\}$$
  
=  $\{2a(||x_{N+n}||^2), -2a(||x_{N+n}||^2)\}$   
=  $\{f(x_{N+n}) + f(-x_{N+n}), -(f(x_{N+n}) + f(-x_{N+n}))\}$   
 $\subset U_0 + U_0 \subset U$ 

for  $n \in \{1, \ldots, N\}$ , whence  $a \in \mathcal{U}$ .

To get continuity of  $\Lambda^{-1}$  it is enough to observe that the homomorphism  $\Lambda_1: \operatorname{Hom}(\mathbb{R}, G) \to \operatorname{Hom}_{\perp}(E, G)$  given by

$$(\Lambda_1 a)(x) = a(||x||^2) \quad \text{for } x \in E$$

is continuous.

COROLLARY 1. If G is Hausdorff and Hom $(\mathbb{R}, G) \neq \{0\}$ , then Hom(E, G) is closed and nowhere dense in Hom $_{\perp}(E, G)$ .

For the proof the following lemma will be used.

LEMMA 1. If Hom( $\mathbb{R}, G$ )  $\neq \{0\}$ , then Hom( $\mathbb{R}, G$ ) is not discrete.

PROOF. Fix arbitrarily a positive integer N, reals  $\alpha_1, \ldots, \alpha_N$  and a neighbourhood U of zero in G. To show that the set

(4) 
$$\{a \in \operatorname{Hom}(\mathbb{R}, G) : a(\alpha_n) \in U \text{ for } n \in \{1, \dots, N\}\}$$

is different from  $\{0\}$  let H be a Hamel basis of  $\mathbb{R}$  (i.e., a basis of the vector space  $\mathbb{R}$  over the field  $\mathbb{Q}$  of rationals) and let  $H_0$  be a finite subset of H such that

$$\alpha_n \in \operatorname{Lin}_{\mathbb{O}} H_0 \quad \text{for} \quad n \in \{1, \dots, N\}.$$

Since (see [2, Theorem 4.2.3]) card  $H = \mathfrak{c}$ , there exists a function  $c_0 \colon H \to \mathbb{R}$  such that

$$c_0(H_0) = \{0\}$$
 and  $c_0(H \setminus H_0) = H.$ 

Let  $c: \mathbb{R} \to \mathbb{R}$  be the additive extension of  $c_0$  and consider an  $a \in \text{Hom}(\mathbb{R}, G) \setminus \{0\}$ . Clearly  $a \circ c$  is additive and

$$a \circ c(\alpha_n) \in a(c(\operatorname{Lin}_{\mathbb{Q}} H_0) = a(\operatorname{Lin}_{\mathbb{Q}} c_0(H_0)) = a(\{0\}) = \{0\}$$

for  $n \in \{1, ..., N\}$  which proves that  $a \circ c$  belongs to set (4). To see that  $a \circ c \neq 0$  consider a  $\beta \in \mathbb{R}$  with  $a(\beta) \neq 0$ . Then

$$\beta \in \operatorname{Lin}_{\mathbb{Q}} H = \operatorname{Lin}_{\mathbb{Q}} c(H \setminus H_0) \subset c(\operatorname{Lin}_{\mathbb{Q}} H) = c(\mathbb{R})$$

whence  $\beta = c(\alpha)$  for some  $\alpha \in \mathbb{R}$  and  $a \circ c(\alpha) = a(\beta) \neq 0$ .

PROOF OF COROLLARY 1. By the standard argument the set Hom(E, G) is closed in  $G^E$ . Since

$$\operatorname{Hom}(E,G) = \Lambda^{-1}(\{0\} \times \operatorname{Hom}(E,G))$$

and  $\Lambda$  is a homeomorphism, it is enough to observe that according to Lemma 1 the set  $\{0\} \times \operatorname{Hom}(E, G)$  is nowhere dense in  $\operatorname{Hom}(\mathbb{R}, G) \times \operatorname{Hom}(E, G)$ .  $\Box$ 

We finish with some remarks.

Remarks.

- 1. Since projections are open, if  $\operatorname{Hom}(\mathbb{R},G)$  is discrete, then so is also G. The converse is not true as the next remark shows.
- 2. If G is uniquely divisible and  $G \neq \{0\}$ , then  $\operatorname{Hom}(\mathbb{R}, G) \neq \{0\}$  and, by Lemma 1,  $\operatorname{Hom}(\mathbb{R}, G)$  is not discrete.
- 3. Hom $(\mathbb{R},\mathbb{Z}) = \{0\}.$
- 4. The following three sentences are equivalent:

$$\operatorname{Hom}(\mathbb{R}, G) = \{0\}, \quad \operatorname{Hom}(E, G) = \{0\}, \quad \operatorname{Hom}_{\perp}(E, G) = \{0\}.$$

 $\Box$
