## BOUNDARY VALUES OF THE SOLUTIONS OF THE PARABOLIC EQUATION

Abstract. The paper deals with the problem of the behaviour of a given solution of a quasi-linear parabolic equation near the parabolic boundary. Necessary and sufficient conditions for weak and strong convergence in the Sobolev space $W_{p}^{1,1}, p \geqslant 2$, are given.

1. Introduction. In the theory of partial differential equations the problem of the behaviour of the given solution near the boundary arises in a natural way. A problem arises while determining if the given solution has trace on the boundary. Several function spaces arise as the spaces of traces of solutions of partial differential equations. The purpose of this paper is to obtain conditions giving $L^{p}$-traces on the boundary of generalized solutions of a quasi-linear parabolic equation. Section 2 deals with the problem of weak convergence of traces for solutions in the Sobolev space $W_{p}^{1,1}, p \geqslant 2$. Section 3 extends these results to strong convergence. The arguments which we give here are based partially on the references [1], [7] and [8].
2. Weak convergence. Consider the quasi-linear parabolic equation of the form

$$
\begin{equation*}
\sum_{t, j=1}^{n}\left(a_{i j}(t, x) u_{x_{j}}\right)_{x_{t}}-b\left(t, x, u, u_{x}\right)-u_{t}=0 \tag{1}
\end{equation*}
$$

in a cylinder $D=(0, T] \times Q$, where $Q \subset R^{n}$ is a bounded domain with the boundary $\partial Q$ of the class $C^{2}, u_{x}=D_{x_{1}} u, u_{x}=\left(u_{x_{2}}, \ldots, u_{x_{n}}\right)$. Let us denote $r(x)=\operatorname{dist}(x, \partial Q)$. We make the following assumptions:
(A) There is a positive constant $\gamma>1$ such that

Received October 20, 1979.
AMS (MOS) subject classification (1980). Primary 35K10.

$$
\gamma^{-1|\xi|^{2}} \leqslant \sum_{i, j=1} a_{i j}(t, x) \xi_{i} \xi_{j} \leqslant \gamma|\xi|^{2}
$$

for all $\xi \in R^{n}$ and $(t, x) \in \bar{D}$.
(B) The coefficients $a_{i j}$ belong to $C^{1}(\bar{D})$.
(C) The function $b(t, x, u, s)$ is defined for $(t, x, u, s) \in D \times R^{n+1}$ and satisfies the following conditions.
(i) for a.e. ( $t, x) \in D, b(t, x, \cdot, \cdot)$ is a continuous function on $R^{n+1}$,
(ii) for every fixed ( $u, s$ ) $\in R^{n+1}, b(\cdot, \cdot, u, s$ ) is a measurable function on $D$,
(iii) for all $(t, x, u, s) \in D \times R^{n+1}$

$$
|b(t, x, u, s)| \leqslant f(t, x)+L(|u|+|s|)
$$

where $L$ is a positive constant and $f: D \rightarrow R$ is a non-negative. measurable function such that

$$
\iint_{D} f(t, x)^{p} r(x)^{\theta} \mathrm{d} x \mathrm{~d} t<\infty
$$

for some constants $p, \Theta$ for which $1<p<\infty, p \leqslant \Theta<2 p-1$.
REMARK 1. Under the assumption (C) the composition $\mathbf{b}(t, x, u(t, x)$, $s(t, x))$ is measurable when $u(t, x), s(t, x)$ are measurable and the mapping

$$
b(t, x, \cdot \cdot \cdot \cdot): L_{l o c}^{1}(D)^{n+1} \rightarrow L_{l o c}^{1}(D)
$$

is continuous, (see [6]).
In the sequel we use the notion of a generalized solution involving the Sobolev spaces: $W_{\text {loc, } p}^{1,1}(D), W_{p}^{1,0}(D), \dot{W}_{p}^{1,0}(D)$. We denote by $W_{\text {loc, }}^{1,1}(D)$ the Sobolev space of real functions $u$ such that $u$ and its distributional derivatives $u_{x_{1}}, \ldots, u_{x_{n}}, u_{t}$ belong to $L_{l o c}^{p}(D)$ and by $W_{p}^{1,0}(D)$ the Sobolev space of real functions $u$ such that $u$ and its distributional derivatives $u_{x_{2}}, \ldots, u_{x_{n}}$ belong to $L^{p}(D)$. The space of the functions $u$ which belong to $W_{p}^{1,0}(D)$ and such that $\operatorname{supp} u \subset \operatorname{Int} D$ we denote by $\dot{W}_{p}^{1,0} D$.

DEFINITION. A function $u$ is said to be a weak solution of the equation (1) in $D$ if $u \in W_{l o c, p}^{1,1}(D)$ and $u$ satisfies

$$
\begin{equation*}
\iint_{D} \sum_{i, j=1}^{n} a_{i j}(t, x) u_{x_{i}} v_{x_{i}} \mathrm{~d} x \mathrm{~d} t+\iint_{D} b\left(t, x, u, u_{x}\right) v \mathrm{~d} x \mathrm{~d} t+\iint_{D} u_{t} v \mathrm{~d} x \mathrm{~d} t=0 \tag{2}
\end{equation*}
$$

for every $v \in \dot{W}_{p^{\prime}}^{1,0}(D)$, where $\frac{1}{p}+\frac{1}{p^{\prime}}=1$.
It follows from the regularity of the boundary $\partial \boldsymbol{Q}$ that there is a number $\delta_{0}>0$ such that for $\delta \in\left(0, \delta_{0}\right]$ the domain $Q_{\mathbf{d}}=\boldsymbol{Q} \cap\{x$ : $\left.=\min _{y \in \partial Q}|x-y|>\delta\right\}$ with the boundary $\partial Q_{0}$, possesses the following property: to each $x_{0} \in \partial Q$ we can assign a unique point $x_{\delta}\left(x_{0}\right)=x_{0}-\delta \nu\left(x_{0}\right)$, where $\nu\left(x_{0}\right)$ is the outward normal to $\partial Q$ at $x_{0}$. The inverse mapping to
$x_{0} \rightarrow x_{\delta}\left(x_{0}\right)$ is given by the formula $x_{0}=x_{\delta}+\delta v_{\delta}\left(x_{\delta}\right)$, where $\nu_{\delta}\left(x_{\delta}\right)$ is the outward normal to $\partial Q_{b}$ at $x_{8}$.

Let $x_{\delta}$ denote an arbitrary point of $\partial Q_{\delta}$. For a fixed $\varepsilon>0$ introduce the sets

$$
\begin{gathered}
A_{\varepsilon}=\partial Q_{\delta} \cap\left\{x:\left|x-x_{\delta}\right|<\varepsilon\right\} \\
B_{\varepsilon}=\left\{x: x=\tilde{x}_{\delta}+\delta \nu_{\delta}\left(\tilde{x}_{\delta}\right), \tilde{x}_{\delta} \in \partial Q_{\delta} \cap\left\{x:\left|x-x_{b}\right|<\varepsilon\right\}\right.
\end{gathered}
$$

and put

$$
\frac{\mathrm{d} S_{\delta}}{\mathrm{d} S_{0}}\left(x_{\delta}\right)=\lim _{\varepsilon \rightarrow 0^{+}} \frac{\left|A_{\varepsilon}\right|}{\left|B_{\varepsilon}\right|},
$$

where $|A|$ denotes the Lebesgue measure of a set $A$. It was proved by Michailov [8] that there is a positive number $\gamma_{0}$ such that

$$
\begin{equation*}
\gamma_{0}^{-1} \leqslant \frac{\mathrm{~d} S_{b}}{\mathrm{~d} S_{0}} \leqslant \gamma_{0} \tag{3}
\end{equation*}
$$

and

$$
\begin{equation*}
\lim _{\delta \rightarrow 0^{+}} \frac{d S_{s}}{d S_{0}}\left(x_{\delta}\left(x_{0}\right)\right)=1 \tag{4}
\end{equation*}
$$

uniformly with respect to $x_{0} \in \partial Q$.
According to Lemma 1 in [3, p. 382], the distance $r(x)$ belongs to $C^{2}\left(\bar{Q}-Q_{\delta_{0}}\right)$ if $\delta_{0}$ is sufficiently small. Denote by $\varrho(x)$ the extension of the function $r(x)$ into $\bar{Q}$ satisfying the following properties: $\varrho(x)=r(x)$ for $x \in \bar{Q}-\boldsymbol{Q}_{\delta_{0}}, \varrho \in C^{2}(\bar{Q}), \varrho(x) \geqslant \frac{3 \delta_{0}}{4}$ in $\boldsymbol{Q}_{\delta_{0}}, \gamma_{1}^{-1} r(x) \leqslant \varrho(x) \leqslant \gamma_{1} r(x)$ in $Q$ for some positive constant $\gamma_{1}, \partial Q_{\delta}=\{x: \varrho(x)=\delta\},\left|\varrho_{x}(x)\right|=1$ for $x \in \bar{Q}-Q_{\delta}, \delta \in\left(0, \delta_{\theta}\right]$ and finally $\partial Q=\{x: \varrho(x)=0\}, \varrho(x)>0$ on $\boldsymbol{Q}$.

Introduce the surface integral for $\mu, \delta \in\left(0, \delta_{0}\right]$ and $u \in W_{\text {ioc, } p}^{1,1}(D)$

$$
M(\mu, \delta)=\left.\int_{u}^{T} \int_{\partial Q_{\delta}}\left|u(t, x)^{p} \mathrm{~d} S_{\delta} \mathrm{d} t+\int_{Q_{\delta}}\right| u(\mu, x)\right|^{p}(r(x)-\delta) \mathrm{d} x,
$$

where the values of the function $u(t, x)$ on the $n$-dimensional manifold are understood in the sense of traces, (see [9]).

Let us denote

$$
\begin{gathered}
D_{\delta}^{\mu}=(\mu, T] \times Q_{\delta}, \partial D_{\delta}^{\mu}=(\mu, T] \times \partial Q_{\delta} \cup\{\mu\} \times Q_{\delta}, \\
\partial D=[0, T] \times \partial Q \cup\{0\} \times Q \text { and } D_{\delta}=D_{\delta}^{\delta} .
\end{gathered}
$$

Here $\partial$ means the parabolic boundary.
THEOREM 1. Let $u$ be a weak solution of (1) for fixed $p \geqslant 2$ and $\iint_{D} u_{t}^{2}|u| p^{p-2} t^{\beta} \mathrm{d} x \mathrm{~d} t<\infty$ for some $\beta<1$. Then the following conditions are equivalent:
I. $M(\delta, \mu)$ is bounded on $\left(0, \delta_{0}\right] \times\left(0, \delta_{0}\right]$,
II. $\iint_{D} u_{x}^{2}|u|^{p-2} r(x) \mathrm{d} x \mathrm{~d} t<\infty$.

Proof. Let for $\mu . \delta \in\left(0, \delta_{0}\right]$

$$
v(t, x)=\left\lvert\, \begin{array}{ll}
u(t, x)|u(t, x)|^{p-2}(\varrho(x)-\delta) & \text { for }(t, x) \in D_{\delta}^{\mu} \\
0, & \text { for }(t, x) \in D^{-} D_{\delta}^{\mu}
\end{array}\right.
$$

Using Hölder's inequality and the well known property of weak derivatives $|u|_{x}=\operatorname{sgn} u \cdot u_{x}$ it is easy to prove that $v$ is an admissible test function in (2). Substituting $v$ in (2) we obtain

$$
\begin{align*}
& \iint_{\mathbf{D}_{\delta}^{\mu}} \sum_{i, j=1}^{n} a_{i j} u_{x_{i}}\left(u|u|^{p-2}\right)_{x_{j}}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t+\iint_{D_{\delta}^{\mu}} \sum_{i, j=1}^{n} a_{i j} u_{x_{i}} u|u|^{p-2} \varrho_{x_{1}} \mathrm{~d} x \mathrm{~d} t+  \tag{5}\\
& +\iint_{D_{\delta}^{\mu}} b\left(t, x, u, u_{x}\right) u|u|^{p-2}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t+\iint_{D_{\delta}^{\mu}} u_{t} u|u|^{p-2}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t=0 .
\end{align*}
$$

By the Green's formula we have
(6) $\left.\left|\iint_{D_{j}^{k}} \sum_{i, j=1}^{n} a_{i j} u_{x_{i}} u\right| u\right|^{p-2} \varrho_{x_{j}} \mathrm{~d} x \mathrm{~d} t|=| \frac{1}{p} \iint_{D_{\delta}^{\mu}} \sum_{i, j=1}^{n}\left(a_{i j}|u|^{p} \varrho_{x_{j}}\right)_{x_{1}} \mathrm{~d} x \mathrm{~d} t+$

$$
\begin{aligned}
& +\frac{1}{p} \iint_{D_{\delta}^{K}} \sum_{i, j=1}^{n}\left(a_{i j} \varrho_{x_{j}}\right)_{x_{i}}|u|^{p} \mathrm{~d} x \mathrm{~d} t\left|=\left|\frac{1}{p} \int_{\mu}^{T} \int_{\partial Q_{\delta}} \sum_{i, j=1}^{n} a_{i j} \varrho_{x_{1}} \varrho_{x^{\prime}}\right| u\right|^{p} \mathrm{~d} S_{\delta} \mathrm{d} t+ \\
& +\left.\frac{1}{p} \iint_{D_{\delta}^{\mu}} \sum_{i, j=1}^{n}\left(a_{i j} \varrho_{x_{j}}\right)_{x_{i}}|u|^{p} \mathrm{~d} x \mathrm{~d} t\left|\leqslant \frac{\gamma}{p} \int_{\mu}^{T} \int_{Q_{Q_{\delta}}}\right| u\right|^{p} \mathrm{~d} S_{\delta} \mathrm{d} t+\frac{C_{1}}{p} \iint_{D_{\delta}^{\mu}}|u|^{p} \mathrm{~d} x \mathrm{~d} t,
\end{aligned}
$$

where $C_{1}=\max _{(t, x) \in D}\left|\sum_{i, j=1}^{n}\left(a_{i j} \varrho_{x_{j}}\right)_{x_{i}}\right|$.
Integrating by parts the last integral in (5) we abtain

$$
\iint_{D_{\delta}^{\mu}} u_{t} u|u|^{p-2}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t=\frac{1}{p} \int_{\mu}^{T} \int_{Q_{\delta}}|u|_{t}^{p}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t=
$$

$$
\begin{equation*}
=\frac{1}{p} \int_{Q_{0}}|u(T, x)|^{p}(\varrho-\delta) \mathrm{d} x-\frac{1}{p} \int_{Q_{0}}|u(\mu, x)|^{p}(\varrho-\delta) \mathrm{d} x . \tag{7}
\end{equation*}
$$

Using the assumption (C) and Young's inequality we have the estimate

$$
\begin{align*}
& \left.\left.\left|\iint_{D_{\delta}^{\mu}} b u\right| u\right|^{p-2}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t\left|\leqslant \iint_{D_{\delta}^{\mu}} f\right| u\right|^{p-1}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t+  \tag{8}\\
& +L \iint_{D_{\delta}^{\mu}}|u|^{p}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t+L \iint_{D_{\delta}^{\mu}}\left|u_{x}\right||u|^{p-1}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t \leqslant \\
& \leqslant \iint_{D_{\delta}^{\mu}} f^{p}(\varrho-\delta)^{\Theta} \mathrm{d} x \mathrm{~d} t+\iiint_{D_{\delta}^{\mu}}|u|^{p}(\varrho-\delta)^{\alpha} \mathrm{d} x \mathrm{~d} t+L \iint_{D_{\delta}^{\mu}}|u|^{p}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t+ \\
& \quad+L \varepsilon \iint_{D_{\delta}^{\mu}} u_{x}^{2}|u|^{p-2}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t+\frac{L}{\varepsilon} \iint_{D_{\delta}^{\mu}}|u|^{p}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t,
\end{align*}
$$

where $\alpha=\frac{p-\Theta}{p-1}$ and $\varepsilon$ is any positive. The assumption (C) implies that $a>-1$.

The first integral in (5) we can estimate as follows

$$
\begin{gather*}
\iint_{D_{b}^{U}} \sum_{t, j=1}^{n} a_{i j} u_{x_{1}}\left(u|u|^{p-2}\right)_{x_{j}}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t= \\
=(p-1) \iint_{D_{\delta}^{U}} \sum_{t, j=1}^{n} a_{i j} u_{x_{1}} u_{x_{j}}|u|^{p-2}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t \geqslant  \tag{9}\\
\geqslant \frac{p-1}{\gamma} \iint_{D_{\delta}^{U}} u_{x}^{2}|u|^{p-2}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t .
\end{gather*}
$$

Thus combining (5)-(9) we obtain

$$
\begin{aligned}
& \frac{p-1}{\gamma} \iint_{D_{\delta}^{\mu}} u_{x}^{2}|u|^{p-2}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t+ \\
& \\
& \quad+\frac{1}{p} \int_{Q_{\delta}}|u(T, x)|^{p}(\varrho-\delta) \mathrm{d} x \leqslant \frac{\gamma}{p} \int_{\mu}^{T} \int_{Q_{\delta}}|u|^{p} \mathrm{~d} S_{\delta} \mathrm{d} t+ \\
& +\left.\frac{1}{p} \int_{Q_{\delta}}\left|u(\mu, x)^{p}(\varrho-\delta) \mathrm{d} x+\frac{C_{1}}{p} \iint_{D_{j}^{\mu}}\right| u\right|^{p} \mathrm{~d} x \mathrm{~d} t+\left(L+\frac{L}{\varepsilon}\right) \iint_{D_{\delta}^{\mu}}|u|^{p}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t+ \\
& \quad+\int_{D_{\delta}^{\mu}} f p(\varrho-\delta)^{\theta} \mathrm{d} x \mathrm{~d} t+\iint_{D_{\delta}^{\mu}}|u|^{p}(\varrho-\delta)^{\alpha} \mathrm{d} x \mathrm{~d} t+L \varepsilon \iint_{D_{\delta}^{\mu}} u_{x}^{2}|u|^{p-2}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t .
\end{aligned}
$$

Choosing $\varepsilon$ such that $\frac{p-1}{2 \gamma}=L \varepsilon$ and reducing the last term we obtain from this inequality

$$
\begin{equation*}
\iint_{D_{\delta}^{\mu}} u_{x}^{2}|u|^{p-2}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t+C_{2} \int_{Q_{\delta}}|u(T, x)|^{p}(\varrho-\delta) \mathrm{d} x \leqslant \tag{10}
\end{equation*}
$$

$$
\leqslant C_{3} \iint_{D_{\delta}^{\mu}}|u|^{p}(\varrho-8)^{a} d x d t+C_{4} \iint_{D} f p^{\theta} r^{\theta} d x d t+C_{3} \iint_{D}|u|^{p} \mathrm{~d} x d t+C_{6} M(\mu, \delta)
$$

where $C_{2}=\frac{2 \gamma}{p(p-1)}, C_{3}=C_{4}=\frac{2 \gamma}{p-1}, C_{5}=\max \left\{\left(L+\frac{L}{\varepsilon}\right) \frac{2 \gamma \gamma_{1}}{p-1} \operatorname{diam}(Q)\right.$, $\left.\frac{2 C_{1} \gamma}{p(p-1)}\right\}$ and $C_{6}=\max \left\{\frac{2 \gamma^{2}}{p(p-1)}, \frac{2 \gamma \gamma_{1}}{p(p-1)}\right\}$.

Let $a \in(-1,0], \delta \in\left(0, \frac{\delta_{0}}{2}\right], \mu \in\left(0, \delta_{0}\right]$ and $x \in Q_{\delta_{0}}$. From the definition of the function $\varrho$ it follows that $(\rho(x)-\delta)^{a} \leqslant\left(\frac{\delta_{\theta}}{4}\right)^{a}$ thus we obtain

$$
\begin{aligned}
& \iint_{D_{0}^{\mu}}|u|^{p}(\varrho-\delta)^{\alpha} \mathrm{d} x \mathrm{~d} t=\int_{\delta_{0}}^{T} \int_{Q_{\delta_{0}}}|u|^{p}(\varrho-\delta)^{a} \mathrm{~d} x \mathrm{~d} t+\int_{\mu}^{T} \int_{Q_{0}-Q_{\delta_{0}}}|u|^{p}(\varrho-\delta)^{\alpha} \mathrm{d} x \mathrm{~d} t+ \\
& +\int_{\mu}^{\delta_{0}} \int_{Q_{\delta_{0}}}|u|^{p}(\varrho-\delta)^{a} \mathrm{~d} x \mathrm{~d} t \leqslant\left(\frac{\delta_{0}}{4}\right)^{\alpha} \int_{\delta_{0}}^{T} \int_{Q_{\delta_{0}}}^{T}|u|^{p} \mathrm{~d} x \mathrm{~d} t+\int_{\mu}^{T} \mathrm{~d} t \int_{\delta_{0}}^{\delta_{0}}(\nu-\delta)^{\alpha} \mathrm{d} v \int_{\boldsymbol{Q}_{0}}|u|^{p} \mathrm{~d} S_{v}+ \\
& \quad+\left(\frac{\delta_{0}}{4}\right)^{a-1} \int_{\mu}^{\delta_{0}} \int_{Q_{\delta_{0}}}|u|^{p}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t \leqslant\left(\frac{\delta_{0}}{4}\right)^{a} \int_{\delta_{0}}^{T} \int_{Q_{\delta_{0}}}|u|^{p} \mathrm{~d} x \mathrm{~d} t+
\end{aligned}
$$

$$
+\frac{\delta_{0}^{a+1}}{a+1} \sup _{0<\delta \leqslant \delta_{0}} \int_{\mu}^{T} \int_{\partial}|u|^{p} \mathrm{~d} S_{\delta} \mathrm{d} t+\left(\frac{\delta_{0}}{4}\right)^{\alpha-1} \delta_{\theta} \sup _{0<\mu \leqslant \delta_{0}} \int_{Q_{0}}|u(\mu, x)| p(\varrho-\delta) d x .
$$

For $\alpha>0$ we have $(\varrho-\delta)^{a} \leqslant C_{7}$, where $C_{7}=\max [\varrho(x)-\delta]^{\alpha}$ so we obtain the following estimate

$$
\begin{equation*}
\iint_{D_{\delta}^{\mu}}|u|^{p}(\varrho-\delta)^{a} \mathrm{~d} x \mathrm{~d} t<C_{8} \tag{11}
\end{equation*}
$$

for $a>-1, \delta \in\left(0, \frac{\delta_{0}}{2}\right], \mu \in\left(0, \delta_{0}\right]$ where the constant $C_{8}$ is independent of $\delta$ and $\mu$.

Now condition (10) implies the estimate

$$
\begin{equation*}
\iint_{D_{\delta}^{\mu}} u_{x}^{2}|u|^{p-2}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t \leqslant C_{9} \tag{12}
\end{equation*}
$$

for $\delta \in\left(0, \frac{\delta_{0}}{2}\right]$ and $\mu \in\left(0, \delta_{0}\right]$ which we can write in the followingg form

$$
\iint_{D} u_{x}^{2}|u|^{p-2} \eta(t, x, \mu, \delta) \mathrm{d} x \mathrm{~d} t \leqslant C_{9}
$$

where

$$
\eta(t, x, \mu, \delta)= \begin{cases}\varrho(x)-\delta, & \text { for }(t, x) \in D_{\delta}^{\mu} \\ 0, & \text { for }(t, x) \in D-D_{\delta}^{\mu}\end{cases}
$$

Hence and from the Monotone Convergence Theorem we obtain condition II what proves the implication $I \Rightarrow$ II.

To prove the implication II $\Rightarrow I$ we show first that condition II implies (11). Let $\alpha>-1, \delta \in\left(0, \frac{\delta_{0}}{2}\right], \mu \in\left(0, \delta_{0}\right]$ and
(14) $\iint_{D_{\delta}^{\mu}}|u|^{p}(\varrho-\delta)^{\alpha} \mathrm{d} x \mathrm{~d} t=\int_{\mu}^{T} \int_{Q_{\delta_{0}}}|u|^{p}(\varrho-\delta)^{\alpha} \mathrm{d} x \mathrm{~d} t+\int_{\mu}^{T} \int_{Q_{0}-Q_{\xi_{0}}}|u|^{p}(\varrho-\delta)^{\alpha} \mathrm{d} x \mathrm{~d} t$.

Integrating by parts we have

$$
\begin{aligned}
& \int_{\mu}^{T} \int_{Q_{\delta_{0}}}|u|^{p}(\varrho-\delta)^{a} \mathrm{~d} x \mathrm{~d} t=\left.T \int_{Q_{\delta_{0}}}\left|u(T, x)^{p}(\varrho-\delta)^{a} \mathrm{~d} x-\mu \int_{Q_{\delta_{0}}}\right| u(\mu, x)\right|^{p}(\varrho-\delta)^{a} \mathrm{~d} x- \\
& \quad-p \int_{\mu}^{T} \int_{Q_{\delta_{0}}} t|u|^{p-2} u u_{t}(\varrho-\delta)^{\alpha} \mathrm{d} x \mathrm{~d} t \leqslant T\left(\frac{\delta_{0}}{4}\right)^{a} \int_{Q_{\delta_{0}}}|u(T, x)|^{p} \mathrm{~d} x+ \\
& \quad+p \sqrt{T}\left[\int_{\mu}^{T} \int_{Q_{\delta_{0}}} u^{2}|u|^{p-2}(\varrho-\delta)^{a} \mathrm{~d} x \mathrm{~d} t\right]^{\frac{1}{2}}\left(\frac{\delta_{0}}{4}\right)^{\frac{a}{2}}\left[\int_{\mu}^{T} \int_{Q_{\delta_{0}}} t|u|^{p-2} u_{t}^{2} \mathrm{~d} x \mathrm{~d} t\right]^{\frac{1}{2}}
\end{aligned}
$$

thus there is a constant $C_{10}$ such that for every $\delta \in\left(0, \frac{\delta_{0}}{2}\right], \mu \in\left(0, \delta_{0}\right]$

$$
\begin{equation*}
\int_{\mu}^{T} \int_{Q_{\delta_{0}}}|u|^{p}(\varrho-\delta)^{\alpha} \mathrm{d} x \mathrm{~d} t<C_{10} \tag{15}
\end{equation*}
$$

From condition II it follows that

$$
\left.\int_{0}^{T} \int_{Q_{\delta_{1}}}| | u\right|_{x} ^{p} \mid \mathrm{d} x \mathrm{~d} t<\infty
$$

because $r(x) \geqslant \frac{3}{4} \delta_{0}$ for $x \in Q_{\delta_{0}}$ and thus $|u| p \in W_{p}^{1,0}\left((0, T) \times Q_{\delta_{0}}\right)$.
It is well known (see [9]), that such function has the trace on the parabolic boundary of $(0, T) \times Q_{\delta_{0}}$ and

$$
\int_{0}^{T} \int_{\partial Q_{\delta_{0}}}|u|^{p} \mathrm{dS} S_{\delta_{0}} \mathrm{~d} t<\infty
$$

As $\varrho(x)=\delta_{0}$ for $x \in \partial Q_{\delta_{0}}$ thus there is a constant $C_{11}$ such that

$$
\begin{equation*}
\int_{\mu}^{T} \int_{\partial Q_{\delta_{0}}}|u| p(\varrho-\delta)^{a} \mathrm{~d} S_{\delta_{0}} \mathrm{~d} t<C_{11} \tag{16}
\end{equation*}
$$

for $\delta \in\left(0, \frac{\delta_{0}}{2}\right]$ and $\mu \in\left(0, \delta_{0}\right]$.
Using the mapping $x \rightarrow x_{\delta}(x)$, (3) and integrating by parts we obtain

$$
\begin{gathered}
\int_{\mu}^{T} \int_{Q_{0}-Q_{\delta_{0}}}|u|^{p}(\rho-\delta)^{\alpha} \mathrm{d} x \mathrm{~d} t=\int_{\mu}^{T} \mathrm{~d} t \int_{\delta}^{\delta_{0}}(\nu-\delta)^{a} \mathrm{~d} \nu \int_{\partial Q_{v}}|u|^{p} \mathrm{~d} S_{\nu} \leqslant \\
\leqslant \gamma_{0} \int_{\mu}^{T} \mathrm{~d} t \int_{\delta}^{\delta_{0}}(\nu-\delta)^{a} \mathrm{~d} \nu \int_{Q} \mid u\left(t, x_{\nu}(x)\right)^{p} \mathrm{~d} S= \\
=\frac{(\nu-\delta)^{a+1}}{a+1} \gamma_{0} \int_{\mu}^{T} \mathrm{~d} t \int_{\partial Q}\left|u\left(t, x_{\nu}(x)\right)^{p \mathrm{~d} S}\right|_{\nu=\delta_{0}}^{\nu=} \begin{array}{l}
\nu= \\
-\frac{p \gamma_{0}}{a+1} \int_{\mu}^{T} \mathrm{~d} t \int_{\delta}^{\delta_{0}}(\nu-\delta)^{a+1} \mathrm{~d} \nu \int_{\partial Q}\left|u\left(t, x_{\nu}(x)\right)\right|^{p} u_{x}(t, x(x)) u\left(t, x_{\nu}(x)\right) \frac{\partial x_{\nu}(x)}{\partial \nu} \mathrm{d} S \leqslant \\
\leqslant \frac{\delta_{0}^{a+1} \gamma_{0}^{2}}{\alpha+1} \int_{\mu}^{T} \int_{\partial Q_{\delta_{0}}}|u|^{p} \mathrm{~d} S_{\delta_{0}} \mathrm{~d} t+\frac{p \gamma_{0}^{2}}{a+1} \int_{\mu}^{T} \mathrm{~d} t \int_{\delta}^{\delta_{0}}(\nu-\delta)^{\alpha+1} \mathrm{~d} v \int_{\partial Q_{\nu}}|u|^{p-1}\left|u_{x}\right| \mathrm{d} S_{\nu},
\end{array}
\end{gathered}
$$

where we have used $\left|\frac{\partial x_{v}}{\partial \nu}\right|=1$.
Now using (16) and Hölder's inequality we have

$$
\begin{aligned}
& \int_{\mu}^{T} \int_{Q_{0}-Q_{\delta_{0}}}|u|^{p}(\varrho-\delta)^{a} \mathrm{~d} x \mathrm{~d} t \leqslant \frac{\delta_{0}^{a+1} \gamma_{0}^{2}}{a+1} C_{11}+\frac{\delta_{0}^{\frac{a+1}{2}} p \gamma_{0}^{2}}{\alpha+1} . \\
& \cdot\left[\int_{\mu}^{T} \mathrm{~d} t \int_{\delta}^{\delta_{0}} \int_{\partial Q_{v}}|u|^{p}(\nu-\delta)^{a} \mathrm{~d} S_{\nu} \mathrm{d} \nu\right]^{\frac{1}{2}}\left[\int_{\mu}^{r} \mathrm{dt} \int_{\delta}^{\delta_{0}} \int_{\partial Q_{V}}|u|^{p-2} u_{x}^{2}(\nu-\delta) \mathrm{d} S_{\nu} \mathrm{d} \nu\right]^{\frac{1}{2}} \leqslant \\
& \leqslant \frac{\delta_{0}^{a+1} \gamma_{0}^{2}}{a+1} C_{11}+ \\
& +\delta_{0}^{\frac{a+1}{2}} \frac{p \gamma_{0}^{2} \sqrt{\gamma_{1}}}{a+1}\left[\int_{\mu}^{T} \int_{Q_{0}-Q_{\delta_{0}}}|u|^{p}(\rho-\delta)^{a} \mathrm{~d} x \mathrm{~d} t\right]^{\frac{1}{2}}\left[\iint_{D} u_{x}^{2}|u|^{p-2} r(x) \mathrm{d} x \mathrm{~d} t\right]^{\frac{1}{2}}
\end{aligned}
$$

From the last estimate it follows

$$
\begin{equation*}
\int_{\mu}^{T} \int_{Q_{0}-Q_{b_{0}}}|u|^{p}(\varrho-\delta)^{\alpha} \mathrm{d} x \mathrm{~d} t<C_{12} \tag{17}
\end{equation*}
$$

for $\delta \in\left[0, \frac{\delta_{0}}{2}\right]$ and $\mu \in\left(0, \delta_{0}\right], C_{12}$ being a convenient positive constant.
Now (14), (15) and (17) imply the condition (11).

From the first part of the proof we have the following equality

$$
\begin{align*}
& \quad \frac{1}{p} \int_{\mu}^{T} \int_{\partial Q_{i}} \sum_{i, j=1}^{n} a_{i j} \varrho_{x_{1}} \varrho_{x_{j}}|u|^{p} \mathrm{~d} S_{\delta} \mathrm{d} t+\frac{1}{p} \int_{Q_{0}}|u(\mu, x)|^{p}(\varrho-\delta) \mathrm{d} x=  \tag{18}\\
& =\frac{1}{p} \int_{D_{\delta}^{\mu}} \sum_{i, j=1}^{n}\left(a_{i j} \varrho_{x_{j}}\right)_{x_{1}}|u|^{p} \mathrm{~d} x \mathrm{~d} t+\iint_{D_{\delta}^{\mu}} b\left(t, x, u, u_{x}\right) u|u| p-2(\varrho-\delta) \mathrm{d} x \mathrm{~d} t+ \\
& +\frac{1}{p} \int_{Q_{0}}\left\{\left.u(T, x)\right|^{p}(\varrho-\delta) \mathrm{d} x+(p-1) \iint_{D_{\delta}^{\mu}} \sum_{i, j=1}^{n} a_{i j} u_{x_{i}} u_{x_{j}}|u| p-2(\varrho-\delta) \mathrm{d} x \mathrm{~d} t .\right.
\end{align*}
$$

Using (A), (B), (C) and the estimate (8) with $\varepsilon=1$ we get

$$
\begin{aligned}
& \frac{1}{p} \int_{n}^{r} \int_{\partial Q_{s}}|u|^{p} \mathrm{~d} S_{\delta} \mathrm{d} t+\frac{1}{p} \int_{Q_{s}}|u(\mu, x)|^{p}(\varrho-\delta) \mathrm{d} x \leqslant \frac{C_{1}}{p} \iint_{D_{b}^{\mu}}|u|^{p} \mathrm{~d} x \mathrm{~d} t+ \\
& +\iint_{D_{b}^{H}} f_{p}(\varrho-\delta)^{\theta} \mathrm{d} x \mathrm{~d} t+\iint_{D_{b}^{U}}|u|^{p}(\varrho-\delta)^{a} \mathrm{~d} x \mathrm{~d} t+2 L \iint_{D_{\delta}^{\mu}}|u| p(\varrho-\delta) \mathrm{d} x \mathrm{~d} t+ \\
& +L \iint_{D_{b}^{\mu}} u_{x}^{2}|u|^{p-2}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t+\frac{1}{p} \int_{Q_{t}}|u(T, x)|^{p}(\varrho-\delta) \mathrm{d} x+ \\
& \quad+\gamma(p-1) \iint_{D^{\mu}} u_{x}^{2}|u|^{p-2}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t .
\end{aligned}
$$

Condition II and the assumption of the theorem imply

$$
\int_{Q}|u(T, x)|^{p} r(x) \mathrm{d} x<\infty .
$$

Thus from assumption (C), (11), condition I and the last inequality it follows the boundness of the function $M(\mu, \delta)$ on $\left(0, \frac{\delta_{0}}{2}\right] \times\left(0, \delta_{0}\right]$.

Let now $\delta \in\left(\frac{\delta_{0}}{2}, \delta_{0}\right]$ and $\mu \in\left(0, \delta_{0}\right]$. A well known property (see [4]) of the traces is that for any function $h \in W_{1}^{1}(G)$

$$
\|h\|_{L^{\prime}(R)} \leqslant K\left\|h_{x}\right\|_{L^{\prime}(G)}
$$

where $R$ is any submanifold of region $G$ and constant $K$ depends only on region $G$. Taking advantage of this fact we get

$$
\begin{aligned}
& \int_{\mu}^{T} \int_{Q_{Q}}|u|^{p}(r-\delta) \mathrm{d} S_{\delta} \mathrm{d} t \leqslant \operatorname{diam}(Q) \int_{\mu}^{T} \int_{\partial Q_{0}}|u| p \mathrm{~d} S_{\delta} \mathrm{d} t \leqslant \\
& \leqslant \operatorname{diam}(Q) K \int_{\mu}^{T} \int_{\frac{Q_{\delta_{0}}}{2}-Q_{\delta_{0}}} \|\left. u_{x}^{p}\left|\mathrm{~d} x \mathrm{~d} t \leqslant \operatorname{diam}(Q) K p \int_{0}^{T} \int_{\frac{Q_{\delta_{0}}}{2}-Q_{\delta_{0}}}\right| u\right|^{p-1}\left|u_{x}\right| \mathrm{d} x \mathrm{~d} t \leqslant \\
& \leqslant \operatorname{diam}(Q) K p\left[\int_{0}^{T} \int_{Q_{\delta_{0}}-Q_{\delta_{0}}} u_{x}^{2}|u|^{p-2} \mathrm{~d} x \mathrm{~d} t\right]^{\frac{1}{2}}\left[\int_{0}^{T} \int_{Q_{\delta_{0}}-Q_{\delta_{0}}}|u|^{p} \mathrm{~d} x \mathrm{~d} t\right]^{\frac{1}{2}} .
\end{aligned}
$$

Thus, from condition II and (17) if $\alpha=0$ and $\delta=\frac{\delta_{0}}{2}$ we get that the first component of the function $M(\mu, \delta)$ is bounded. For the second component we have the simple estimate

$$
\int_{Q_{0}}|u(\mu, x)|^{p}(r(x)-\delta) \mathrm{d} x \leqslant \int_{\frac{Q_{\delta_{0}}}{2}}|u(\mu, x)|^{p}\left(r(x)-\frac{\delta_{0}}{2}\right) \mathrm{d} x
$$

so from the previous case we get that the function $M(\mu, \delta)$ is bounded in the region $\left(0, \delta_{0}\right] \times\left(0, \delta_{0}\right]$ what proves condition I. This ends the proof of Theorem 1.

Let us define the functions $M(\delta)=M(\delta, \delta)$ and

$$
\bar{M}(\delta)=\int_{0}^{T} \int_{\partial Q_{0}} \sum_{i, j=1}^{n} a_{i j} \varrho_{x_{1}} \varrho_{x}|u|^{p} \mathrm{~d} s_{\delta} \mathrm{d} t+\int_{Q_{\delta}}|u(\delta, x)|^{p}(\varrho-\delta) \mathrm{d} x
$$

The assumption ( $A$ ) implies

$$
\begin{equation*}
\frac{1}{\gamma} M(\delta) \leqslant \bar{M}(\delta) \leqslant \varrho M(\delta) \tag{19}
\end{equation*}
$$

From the results of Gagliardo [2] it follows that if $u \in W_{\text {loc, }}^{1,1}(D)$ then the functions $M(\delta)$ and $\bar{M}(\delta)$ are absolutely continuous on ( $0, \delta_{0}$ ], (see [1]).

REMARK 2. Under the assumptions of Theorem 1 condition I can be replaced by
III. $\bar{M}(\delta)$ is continuous on $\left[0, \delta_{0}\right]$
or
IV. $M(\delta)$ is bounded on $\left(0, \delta_{0}\right.$ ].

Indeed, condition I follows from III and (19). Using the Dominated and Monotone Convergence Theorems we imply from (18) that there exists $\lim \bar{M}(\delta)$, thus we proved condition III. Condition IV follows ${ }^{\delta \rightarrow 0+}$ from (19).

Let us consider the space $\bar{L}^{p}(\partial D)$ of all functions such that

$$
\|f\|_{\mathcal{P}}=\left[\int_{0}^{T} \int_{\partial Q}|f(t, x)|^{p} \mathrm{~d} S \mathrm{~d} t+\int_{Q}|f(0, x)|^{p} r(x) \mathrm{d} x\right]^{\frac{1}{p}}<\infty .
$$

For $p>1$ the space $L^{p}$ with the norm $\|\cdot\|_{p}$ is a reflexive Banach space and the space $L^{p^{\prime}}$ is dual to $L^{p}$, where $\frac{1}{p}+\frac{1}{p^{\prime}}=1$. Moreover the space $L^{2}$ is uniformly convex.

Let us denote

$$
u_{\delta}(t, x)= \begin{cases}u\left(t, x_{\delta}(x)\right), & \text { for }(t, x) \in(0, T] \times \partial Q \\ u(\delta, x), & \text { for }(t, x) \in\{0\} \times Q,\end{cases}
$$

where $u$ is a solution of $(1)$, and $\delta \in\left(0, \delta_{0}\right]$. Here the values of the function on the lower-dimensional manifold are understood as its trace on that manifold (see[9]).

THEOREM 2. Let $u$ be a weak solution of (1) for fixed $p \geqslant 2$ and $\iint_{D} u_{t}^{2}|u|^{p-2} t^{\beta} \mathrm{d} x \mathrm{~d} t<\infty$ for some $\beta<1$. Assume one of the conditions I or II holds. Then there is a sequence $\delta_{k} \rightarrow 0$ as $k \rightarrow \infty$ and a function $\varphi \in \tilde{L}^{p}(\partial D)$ such that

$$
\begin{aligned}
& \lim _{k \rightarrow \infty}\left[\int_{0}^{T} \int_{\partial Q}\left(u\left(t, x_{\delta_{k}}(x)\right)-\varphi(t, x) g(t, x)\right) \mathrm{d} S \mathrm{~d} t+\right. \\
& \left.\quad+\int_{Q}\left(u\left(\delta_{k}, x\right)-\varphi(0, x)\right) g(0, x) r(x) \mathrm{d} x\right]=0
\end{aligned}
$$

for each $g \in \bar{L}^{p^{\prime}}(\partial D)$.
Proof. From condition I of Theorem 1 and (3) we have

$$
\begin{aligned}
& C_{13}>\int_{0}^{T} \int_{\partial}|u(t, x)|^{p} \mathrm{~d} S_{\mathrm{g}} \mathrm{~d} t+\int_{Q} \mid u(\mu, x)^{p} r(x) \mathrm{d} x \geqslant \\
& \left.\geqslant \frac{1}{\gamma_{0}} \int_{0}^{T} \int_{\partial} \right\rvert\, u\left(t,\left.x_{b}(x)\right|^{p} \mathrm{~d} S \mathrm{~d} t+\int_{Q}|u(\mu, x)|^{p} r(x) \mathrm{d} x\right.
\end{aligned}
$$

for any $\delta, \mu \in\left(0, \delta_{0}\right]$ and some constant $C_{13}$.
Now taking $\delta=\mu$ we get $\left\|u_{\delta}\right\|_{p}<C_{13}$ for $\delta \in\left(0, \delta_{0}\right]$. Thus the set $\left\{u_{\delta}: \delta \in\left(0, \delta_{0}\right]\right\}$ is weak compact in $L^{p}(\partial D)$ and hence the result follows.

We need some lemmas in the following
LEMMA 1. Let $u \in W_{\text {loc. }}^{1,1}(D), a>-1$ and for some constant $\beta<1$ $\iint_{D} u_{t}^{2}|u|^{p-2} t^{\beta} \mathrm{d} x \mathrm{~d} t<\infty$. Then there exists constants $C_{14}$ and $C_{15}$ such that
and

$$
\begin{equation*}
\iint_{D}|u|^{p}(t-\delta)^{a} \mathrm{~d} x \mathrm{~d} t<C_{14} \tag{20}
\end{equation*}
$$

$$
\begin{equation*}
\int_{Q_{S}} \mid u(\delta, x)^{p} \mathrm{~d} x<C_{15} \tag{21}
\end{equation*}
$$

for $\delta \in\left(0, \frac{\delta_{0}}{2}\right]$.

Proof. Integrating by parts we get

$$
\begin{gathered}
\iint_{D_{\Delta}}|u|^{p}(t-\delta)^{\mathbf{a}} \mathrm{d} x \mathrm{~d} t=\left.\frac{(t-\delta)^{a+1}}{a+1} \int_{Q_{S}}|u|^{p} \mathrm{~d} x\right|_{t=\delta} ^{t=T}-\iint_{D_{0}} \frac{(t-\delta)^{\alpha+1}}{a+1}(|u| p)_{t} \mathrm{~d} x \mathrm{~d} t= \\
=\frac{(T-\delta)^{a+1}}{a+1} \int_{Q_{0}}|u(T, x)|^{p} \mathrm{~d} x-\frac{p}{a+1} \int_{D_{0}}(t-\delta)^{\alpha+1}|u| p-2 u u_{t} \mathrm{~d} x \mathrm{~d} t \leqslant \\
\leqslant \frac{T^{a+1}}{a+1} \int_{D}|u(T, x)|^{p} \mathrm{~d} x+\frac{p}{a+1} T^{\frac{a+1}{2}}\left[\iint_{D_{0}} u_{t}^{2}|u|^{p-2}(t-\delta) \mathrm{d} x \mathrm{~d} t\right]^{\frac{1}{2}} . \\
\left.\quad \cdot\left[\iint_{D_{0}}|u|^{p-2} u^{2}(t-\delta)^{a} \mathrm{~d} x \mathrm{~d} t\right]^{\frac{1}{2}} \leqslant \frac{T^{a+1}}{a+1} \int \right\rvert\, u(T, x)^{p} \mathrm{~d} x+ \\
\quad+\frac{p}{a+1} T^{\frac{a+1}{2}}\left[\iint_{D} u_{t}^{2}|u|^{p-2 t} \mathrm{~d} x \mathrm{~d} t\right]^{\frac{1}{2}}\left[\iint_{D_{0}}|u|^{p}(t-\delta)^{a} \mathrm{~d} x \mathrm{~d} t\right]^{\frac{1}{2}}
\end{gathered}
$$

which implies (20).
Condition (21) follows from the estimate

$$
\begin{gathered}
\int_{Q_{0}}|u(\delta, x)|^{p} \mathrm{~d} x=\int_{Q_{0}}|u(T, x)|^{p} \mathrm{~d} x-\iint_{D_{0}}\left(|u|^{p}\right)_{t} \mathrm{~d} x \mathrm{~d} t=\int_{Q_{0}}|u(\mathrm{~T}, x)|^{p} \mathrm{~d} x- \\
\quad-p \iint_{D_{0}}|u|^{p-2} u u_{t} \mathrm{~d} x \mathrm{~d} t \leqslant \int_{Q}|u(T, x)|^{p} \mathrm{~d} x+ \\
+p\left[\iint_{D_{0}} u_{i}^{2}|u|^{p-2}(t-\delta)^{\beta} \mathrm{d} x \mathrm{~d} t\right]^{\frac{1}{2}}\left[\iint_{D_{s}}|u|^{p}(t-\delta)^{-\beta} \mathrm{d} x \mathrm{~d} t\right]^{\frac{1}{2}}
\end{gathered}
$$

at the basis of (20).
LEMMA 2. Under the assumptions of Theorem 1 condition II implies

$$
\iint_{D} u_{x}^{2} r \mathrm{~d} x \mathrm{~d} t<\infty .
$$

Proof. By Theorem 1 condition II implies the boundedness of the function $\bar{M}(\delta)=\int_{\delta}^{T} \int_{Q_{\delta}}\left(u^{2}+1\right)^{\frac{p}{2}} \mathrm{~d} S \mathrm{~d}$. Repeating the proof of the implication I $\Rightarrow$ II of Theorem 1 with

$$
v(t, x)= \begin{cases}u\left(u^{2}+1\right)^{\frac{p-2}{2}}(o-\delta), & \text { for }(t, x) \in D_{\delta} \\ 0, & \text { for }(t, x) \notin D_{\delta}\end{cases}
$$

as a test function we obtain

$$
\iint_{D} u_{x}^{2}\left(u^{2}+1\right)^{\frac{p-2}{2}} r \mathrm{~d} x \mathrm{~d} t<\infty
$$

and the result follows.
Let us denote by $K(t, x)=\sum_{i, j=1}^{n} a_{i j}(t, x) \varrho_{x_{i}}(x) \varrho_{x,}(x)$. Then we have
following lemma.

LEMMA 3. Under the assumptions of Theorem 2 the function

$$
G(\delta)=\int_{0}^{T} \int_{\partial} u\left(t, x_{\delta}(x)\right) g(t, x) K(t, x) \mathrm{d} S \mathrm{~d} t+\int_{Q} u(\delta, x) g(0, x) \varrho(x) \mathrm{d} x
$$

is continuous on $\left[0, \delta_{0}\right]$ and
(22) $\lim _{\delta \rightarrow 0^{+}} G(\delta)=\int_{0}^{T} \int_{\boldsymbol{Q}} \varphi(t, x) g(t, x) K(t, x) \mathrm{d} S \mathrm{~d} t+\int_{\boldsymbol{Q}} \varphi(0, x) g(0, x) \varrho(x) \mathrm{d} x$
for any function $g$ in $\frac{1}{} \frac{p}{p-1}_{\text {f }}^{\text {( }} \mathrm{D}$ ).
Proof. Of course, $G(\delta)$ is continuous on $\left(0, \delta_{0}\right.$ ] so it suffices to prove continuity at $\delta=0$. Since $\left\|u_{\delta}\right\|_{p}<C_{13}$ for $\delta \in\left(0, \delta_{0}\right]$ and elements of $C^{1}(\bar{D})$ restricted to $\partial D$ are dense in $L^{\frac{p}{p-1}}(\partial D)$ we can assume that there is $a \bar{g} \in C^{1}(\bar{D})$ such that $\left.\bar{g}\right|_{\partial Q}=g$. From (2), taking $v=\bar{g}(\rho-\delta)$ for $(t, x) \in D_{\delta}$ and $v=0$ for $(t, x) \notin D_{\delta}$ as a test function we have

$$
\begin{array}{r}
\iint_{D_{j}}\left[\sum_{i, j=1}^{n} a_{i j} u_{x_{i}} \bar{g}_{x_{j}}(\varrho-\delta)+\sum_{i, j=1}^{n} a_{i j} u_{x i} \bar{y} \varrho_{x j}+b \bar{g}(\varrho-\delta)+\right.  \tag{23}\\
\left.+u_{t} \bar{g}(\varrho-\delta)\right] \mathrm{d} x \mathrm{~d} t=0 .
\end{array}
$$

By the Green's formula we have
$\iint_{D_{\delta}} \sum_{i, j=1}^{n} a_{i j} u_{x_{1}} g \varrho_{x}, \mathrm{~d} x \mathrm{~d} t=-\int_{j}^{T} \int_{\partial Q_{\delta}} \sum_{j=1}^{n} a_{i j} \varrho_{x_{1}} \varrho_{x}, u \bar{g} \mathrm{~d} S_{\delta} \mathrm{d} t-$

$$
\begin{equation*}
-\iint_{D_{0}} \sum_{i, j=1}^{n}\left(a_{i j \varrho_{x_{j}}} \bar{g}\right)_{x_{i}} u \mathrm{~d} x \mathrm{~d} t=-\int_{\delta}^{T} \int_{\partial Q} u\left(t, x_{\delta}(x)\right) g(t, x) K(t, x) \mathrm{d} S \mathrm{~d} t- \tag{24}
\end{equation*}
$$

$$
\begin{gathered}
-\int_{\delta}^{T} \int_{\partial Q} u\left(t, x_{\delta}(x)\right)\left[\frac{\mathrm{d} S_{\delta}}{\mathrm{d} S}\left(x_{\dot{\delta}}(x)\right) \bar{g}\left(t, x_{\delta}(x)\right) K\left(t, x_{\delta}(x)\right)-g(t, x) K(t, x)\right] \mathrm{d} S \mathrm{~d} t- \\
-\iint_{D_{\delta}} \sum_{i, j=1}^{n}\left(a_{i j} \varrho_{x_{j}} \bar{g}\right)_{x_{i}} u \mathrm{~d} x \mathrm{~d} t
\end{gathered}
$$

Integrating by parts the last term in (23) we get

$$
\begin{gather*}
\iint_{D_{d}} u_{t} \bar{g}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t=\int_{Q_{0}} u(T, x) \bar{y}(T, x)(\varrho(x)-\delta) \mathrm{d} x- \\
-\int_{Q_{0}} u(\delta, x) \bar{g}(\delta, x)(\varrho(x)-\delta) \mathrm{d} x-\iint_{D_{0}} u \bar{g}_{t}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t=  \tag{25}\\
=\int_{Q_{0}} u(T, x) \bar{g}(T, x)(\varrho(x)-\delta) \mathrm{d} x-\int_{Q_{0}} u(\delta, x) g(0, x)(\varrho(x)-\delta) \mathrm{d} x- \\
-\int_{Q_{0}} u(\delta, x)(\varrho(x)-\delta)[\bar{y}(\delta, x)-g(0, x)] \mathrm{d} x-\iint_{D_{0}} u \bar{g}_{t}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t .
\end{gather*}
$$

From (23), (24) and (25) we obtain

$$
\begin{align*}
& G(\delta)=\int_{0}^{\delta} \int_{Q_{Q}} u\left(t, x_{\delta}(x)\right) g(t, x) K(t, x) \mathrm{d} S \mathrm{~d} t+\int_{Q-Q_{0}} u(\delta, x) g(0, x) \varrho(x) \mathrm{d} x+ \\
& +\delta \int_{Q_{0}} u(\delta, x) g(0, x) \mathrm{d} x+\iint_{D_{b}} \sum_{i, j=1}^{n} a_{i j} u_{x_{1}} \bar{g}_{x_{2}}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t-  \tag{26}\\
& -\int_{\delta}^{T} \int_{\partial Q} u\left(t, x_{\delta}(x)\right)\left[\frac{\mathrm{d} S_{\delta}}{\mathrm{d} S}\left(x_{\delta}(x)\right) \bar{y}\left(t, x_{\delta}(x)\right) K\left(t, x_{\delta}(x)\right)-g(t, x) K(t, x)\right] \mathrm{d} S \mathrm{~d} t- \\
& -\iint_{D_{i}} \sum_{i, j=1}^{n}\left(a_{i j} \varrho_{x_{j}} \bar{y}\right)_{x_{i}} u d x d t+\iint_{D_{0}} b \bar{y}(\varrho-\delta) \mathrm{d} x d t+\int_{Q_{0}} u(T, x) \bar{y}(T, x)(\varrho(x)-\delta) \mathrm{d} x- \\
& -\iint_{D_{\mathrm{s}}} u \bar{y}_{\mathrm{t}}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t-\int_{Q_{\mathrm{a}}} u(\delta, x)(\varrho(x)-\delta)[\bar{g}(\delta, x)-g(0, x)] \mathrm{d} x .
\end{align*}
$$

Let us denote the integrals on the right side of (26) respectively by $J_{1}, J_{2}, \ldots, J_{10}$. We have the following estimates

$$
\left|J_{1}\right| \leqslant\left[\int_{0}^{T} \int_{\partial Q} \mid u\left(t, x_{\partial}(x)\right)^{p} \mathrm{~d} S \mathrm{~d} t\right]^{\frac{1}{p}}\left[\int_{0}^{\delta} \int_{\partial}|g K|^{\frac{p}{p-1}} \mathrm{~d} S \mathrm{~d} t\right]^{\frac{p-1}{p}}
$$

and

$$
\left|J_{2}\right| \leqslant\left[\int_{Q} \mid u(\delta, x)^{p} \varrho(x) \mathrm{d} x\right]^{\frac{1}{p}}\left[\int_{\mathcal{Q}-Q_{0}} \left\lvert\, g(0, x)^{\frac{p}{p-1}} \varrho(x) \mathrm{d} x\right.\right]^{\frac{p-1}{p}}
$$

so condition I implies

$$
\lim _{\delta \rightarrow 0^{+}} J_{1}=\lim _{\delta \rightarrow 0^{+}} J_{2}=0
$$

Similarly from (4), Lemma 1 and uniform continuity of the functions $K$ and $\bar{g}$ we get

$$
\lim _{\delta \rightarrow 0^{+}} J_{3}=\lim _{\delta \rightarrow 0^{+}} J_{5}=\lim _{\delta \rightarrow 0^{+}} J_{10}=0
$$

Continuity at $\delta=0$ of $J_{6}$ follows from the integrability of $u$.
Applying assumption (C) and the result of Lemma 1 we can easily show that other integrals have the integrable majorants independent of $\delta$ and the integrands are continuous for almost all $(t, x) \in D$ or $x \in Q$ respectively, thus from the Monotone and Dominated Convergence Theorems follows their continuity at $\delta=0$. So we proved the continuity of $G(\delta)$ on $\left[0, \delta_{0}\right]$.

Now, the equality (22) is a simple consequence of Theorem 2.
Let us define the following norm in $\operatorname{Lep}^{p}(\partial D)$

$$
\|f\|_{p}^{1}=\left[\left.\int_{0}^{T} \int_{\partial Q}\left|f(t, x)^{p} K(t, x) \mathrm{d} S \mathrm{~d} t+\int_{Q}\right| f(0, x)\right|^{p} \varrho(x) \mathrm{d} x\right]^{\frac{1}{p}}
$$

Since $\gamma^{-1} \leqslant K(t, x) \leqslant \gamma$ and $\gamma_{1}^{-1} r(x) \leqslant \varrho(x) \leqslant \gamma_{1} r(x)$ it follows that the norm $\|\cdot\|_{p}^{1}$ is equivalent to the norm $\|\cdot\|_{p}$ in $L^{p}(\partial D)$. Thus Lemma 3 implies the following theorem.

THEOREM 3. Under the assumptions of Theorem $2 u_{\delta}$ weakly converges in $L^{p}(\partial)$ to the function $\varphi$, as $\delta \rightarrow 0^{+}$, where $\varphi$ is defined in Theorem 2.
3. Strong convergence. We begin with a theorem on $L^{2}$-convergence.

For $\delta \in\left(0, \delta_{0}\right]$ we can extend the mapping $x_{i}: \partial Q \rightarrow \partial Q_{\delta}$ on $Q-Q_{\delta}$ in such a way that for $x \in Q-Q_{z}$ we have $x_{8}(x)=x_{8}\left(x^{\prime}\right)$, where $x^{\prime} \in \partial Q$ and $x^{\prime}-x=\eta \nu\left(x^{\prime}\right)$ for some $\eta \in(0, \delta]$. Now we can define the mapping $x^{\delta}: Q \rightarrow Q_{\frac{\delta}{2}}$ by

$$
x^{\delta}(x)= \begin{cases}x & , \text { for } x \in Q_{\delta} \\ x_{\delta}(x)+\frac{1}{2}\left(x-x_{\delta}(x)\right), & \text { for } x \in Q-Q_{\delta}\end{cases}
$$

Thus $x^{8}(x)=x$ for each $x \in Q_{8}$ and $x^{\delta}(x)=x_{\frac{8}{2}}(x)$ for each $x \in \partial Q$. Moreover $\varrho\left(x^{\delta}\right) \geqslant \frac{\delta}{2}$ and $\gamma_{2}^{-1} \leqslant\left|J_{x^{\mathrm{d}}}(x)\right| \leqslant \gamma_{2}$, where constant $\gamma_{2}$ is independent of $\delta$ and $J_{x^{\delta}}(x)$ is the Jacobian of the mapping $x^{\delta}(\cdot)$.

Let us denote

$$
t^{\delta}(t)= \begin{cases}t, & \text { for } t \in[\delta, T] \\ \frac{1}{2} t+\frac{1}{2} \delta, & \text { for } t \in[0, \delta]\end{cases}
$$

LEMMA 4. Let $h$ be a non-negative function in $L^{1}\left(D_{\frac{\delta}{2}}-D_{\delta}\right)$. Then

$$
\begin{equation*}
\iint_{D-D_{s}} h\left(t^{\delta}, x^{\delta}\right) \mathrm{d} x \mathrm{~d} t \leqslant \max \left(2 \gamma_{2}, 2\right) \iint_{\bar{D}_{\frac{\delta}{2}}} \int_{\boldsymbol{D}_{\delta}} h(t, x) \mathrm{d} x \mathrm{~d} t \tag{27}
\end{equation*}
$$

and if $h \in L^{1}(D)$ then $\lim _{\delta \rightarrow 0^{+}} \iint_{D-D_{\delta}} h\left(t^{\delta}, x^{\delta}\right) \mathrm{d} x \mathrm{~d} t=0$.
Proof. By change of variables we get

$$
\begin{aligned}
& \iint_{D-D_{0}} h\left(t^{\delta}, x^{\delta}\right) \mathrm{d} x \mathrm{~d} t=\int_{\delta}^{T} \int_{Q-Q_{0}} h\left(t, x^{\delta}(x)\right) \mathrm{d} x \mathrm{~d} t+\int_{0}^{\delta} \int_{Q-Q_{s}} h\left(t^{\delta}, x^{\delta}\right) \mathrm{d} x \mathrm{~d} t+ \\
& +\int_{0}^{\delta} \int_{Q_{\delta}} h\left(t^{\delta}(t), x\right) \mathrm{d} x \mathrm{~d} t=\int_{\delta}^{T} \int_{x^{\delta}\left(Q-Q_{0}\right)} h(t, x) J_{x^{\delta}}^{-1}(x) \mathrm{d} x \mathrm{~d} t+ \\
& +2 \int_{\frac{\partial}{2}}^{\delta} \int_{x^{\delta}\left(Q-Q_{\delta}\right)} h(t, x) J_{x^{\delta}}^{-1}(x) \mathrm{d} x \mathrm{~d} t+2 \int_{\frac{\delta}{2}}^{\delta} \int_{Q_{\delta}} h(t, x) \mathrm{d} x \mathrm{~d} t \leqslant \gamma_{2} \int_{\delta}^{T} \int_{Q_{\frac{\delta}{2}}-Q_{\delta}} h \mathrm{~d} x \mathrm{~d} t+ \\
& +2 \gamma_{2} \int_{\frac{\delta}{2}}^{\delta} \int_{Q_{\delta}^{2}} h \mathrm{~d} x \mathrm{~d} t+2 \int_{\frac{\delta}{2}}^{\delta} \int_{Q_{\delta}} h \mathrm{~d} x \mathrm{~d} t \leqslant \max \left(2 \gamma_{2}, 2\right) \quad \iint_{D_{\frac{\delta}{2}}-D_{\delta}} h \mathrm{~d} x \mathrm{~d} t .
\end{aligned}
$$

Now the second part of the assertion is obvious by the well known property of integral.

THEOREM 4. Let $u$ be a weak solution of (1) for $p=2, \iint_{D} u_{t}^{2} t^{\beta} d x d t<$ $<\infty$ for some $\beta<1$ and let one of conditions I or II hold for $p=2$. Then there is a function $\varphi$ belonging to $L^{p}(\partial D)$ such that

$$
\lim _{b \rightarrow 0^{+}} u_{b}=\varphi \text { strong in } L^{2}(\partial D) .
$$

Proof. As $\|\cdot\|_{2}$ and $\|\cdot\|_{2}^{1}$ are equivalent it suffices to show that there is a $\varphi \in \mathcal{L}^{2}(\partial D)$ such that $\lim \left\|\varphi-u_{\mathrm{g}}\right\|_{2}^{1}=0$. By Theorem 3 there is a $\varphi \in L^{2}(\partial D)$ such that $\lim _{\delta \rightarrow 0^{+}} u_{\delta}{ }^{0^{+}}=\varphi$ weakly in $L^{2}$. Since $L^{2}(\partial D)$ is uniformly convex it suffices to show that $\lim _{s \rightarrow 0^{+}}\left\|u_{s}\right\|_{2}^{1}=\|\varphi\|_{2}^{1}$.

Let us denote by $<\cdot, \cdot\rangle$ the inner product $L^{2}(\partial D)$ with the norm $\|\cdot\|_{2}^{1}$ and

$$
\psi(\mathbf{g})=\sum_{i, j=1}^{n} a_{i}, u_{x i} g_{x} \varrho-\sum_{i, j=1}^{n}\left(a_{i j} \varrho_{x}, g\right)_{x_{i}} u+b g \varrho-u g_{t} \varrho .
$$

Observe that if $u \in W_{i o c, p}^{1,1}(D)$ then $u\left(t^{d}, x^{b}\right) \in W_{p}^{1,1}(D)$, thus, as in the proof of Lemma 3 (see [26]), we find that

$$
\langle\varphi, g\rangle=\iint_{D} \psi(g) \mathrm{d} x \mathrm{~d} t+\int_{Q} u(T, x) g(T, x) \varrho(x) \mathrm{d} x
$$

for any $g \in C^{1}(\bar{D})$ and hence for any $g \in W_{p}^{1,1}(D)$.
Taking $g=u\left(t^{\delta}, x^{\delta}\right)$ we obtain

$$
\begin{align*}
& \left\langle\varphi, u\left(t^{\delta}, x^{\delta}\right)\right\rangle=\iint_{D_{s}} \psi(u(t, x)) \mathrm{d} x \mathrm{~d} t+\int_{Q_{0}} u^{2}(T, x) \varrho(x) \mathrm{d} x+  \tag{28}\\
+ & \iint_{D-D_{0}} \psi\left(u\left(t^{\delta}, x^{\delta}(x)\right)\right) \mathrm{d} x \mathrm{~d} t+\int_{Q-Q_{D}} u(T, x) u\left(T, x^{\delta}(x)\right) \varrho(x) \mathrm{d} x
\end{align*}
$$

as $x^{\delta}(x)=x$ and $t^{\delta}(t)=t$ for $x \in Q_{\delta}$ and $t \in[\delta, T]$.
We show that

$$
\begin{equation*}
\lim _{\delta \rightarrow 0^{+}} \int_{Q-Q_{\delta}} u(T, x) u\left(T, x^{\delta}(x)\right) \varrho(x) \mathrm{d} x=0 \tag{29}
\end{equation*}
$$

and

$$
\begin{equation*}
\lim _{\delta \rightarrow 0^{+}}\left[\iint_{D_{B}} \psi(u(t, x)) \mathrm{d} x \mathrm{~d} t+\int_{Q_{0}} u^{2}\left(\mathrm{~T}^{\prime}, x\right) \varrho(x) \mathrm{d} x\right]=\lim _{\delta \rightarrow 0^{+}}\left(\left\|u_{\delta}\right\|_{2}^{1}\right)^{2} . \tag{31}
\end{equation*}
$$

From Theorem 3 we have that

$$
\left(\|p\|_{2}^{1}\right)^{2}=\lim _{\delta \rightarrow 0^{+}}\left\langle\varphi, u\left(t^{j}, x^{\delta}\right)\right\rangle
$$

because $x^{\delta}(x)=x_{\frac{\delta}{2}}(x)$ on $\partial Q$ and $t^{\delta}(0)=\frac{1}{2} \delta$, so from (28)-(31) it follows that $\lim _{s \rightarrow 0^{+}}\left\|u_{\delta}\right\|_{2}^{2}=\|\varphi\|_{2}^{1}$ as required.
${ }_{8 \rightarrow 0^{+}}$
To prove (29)-(31) set

$$
v(t, x)= \begin{cases}u(t, x)(\varrho-\delta), & \text { for }(t, x) \in D_{\delta}, \\ 0, & \text { for }(t, x) \in D-D_{\delta}\end{cases}
$$

in equation (2) and thus we obtain

$$
\begin{gather*}
\iint_{D_{i}}\left[\sum_{i, j=1}^{n} a_{i j} u_{x_{1}} u_{x_{i}}(\varrho-\delta)+\sum_{i, j=1}^{n} a_{i j} u_{x_{i}} u_{\varrho_{j}}+b u(\varrho-\delta)+\right.  \tag{32}\\
\left.+u_{t} u(\varrho-\delta)\right] \mathrm{d} x \mathrm{~d} t=0 .
\end{gather*}
$$

Condition II and equality

$$
\lim _{\delta \rightarrow 0^{+}} \iint_{D i} \sum_{i, j=1}^{n} a_{i j} u_{x_{i}} u_{x,}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t=\iint_{D} \sum_{i, j=1}^{n} a_{i j} u_{x_{i}} u_{x,} \varrho \mathrm{~d} x \mathrm{~d} t
$$

imply

$$
\lim _{\delta \rightarrow 0^{+}} \delta \iint_{D_{\delta}} \sum_{i, j=1}^{n} a_{i j} u_{x_{1}} u_{x_{j}} \mathrm{~d} x \mathrm{~d} t=0 .
$$

Similarly using (11), Hölder's inequality we obtain that

$$
\lim _{\delta \rightarrow 0^{+}} \delta \iint_{D_{\delta}} b u \mathrm{~d} x \mathrm{~d} t=0 .
$$

From the assumption of the theorem and (11) we get

$$
\begin{aligned}
\left|\delta \iint_{D_{s}} u u_{t} \mathrm{~d} x \mathrm{~d} t\right| & \leqslant \delta \iint_{D_{s}} u^{2} \mathrm{~d} x \mathrm{~d} t+\delta \iint_{D_{s}} u_{t}^{2} \mathrm{~d} x \mathrm{~d} t \leqslant \\
& \leqslant \delta \iint_{D} u^{2} \mathrm{~d} x \mathrm{~d} t+\delta^{1-\beta} \iint_{D_{\delta}} t^{\beta} u_{t}^{2} \mathrm{~d} x \mathrm{~d} t
\end{aligned}
$$

thus

$$
\lim _{\delta \rightarrow 0^{+}} \delta \iint_{D_{\delta}} u u_{t} \mathrm{~d} x \mathrm{~d} t=0 .
$$

Hence and from (32) we have

$$
\begin{gathered}
\lim _{\delta \rightarrow 0^{+}}\left[\iint_{D_{\delta}} \psi(u) \mathrm{d} x \mathrm{~d} t+\int_{Q_{S}} u^{2}(T, x) \varrho(x) \mathrm{d} x\right]= \\
=\lim _{\delta \rightarrow 0^{+}}\left\{\int_{D_{0}}\left[-\sum_{i, j=1}^{n} a_{i,} u_{x_{i}} u \varrho_{x_{j}}-\sum_{i, j=1}^{\sum_{i}}\left(a_{i j} \varrho_{x_{j}} u\right)_{x_{1}} u-2 u u_{t}(\varrho-\delta)\right] \mathrm{d} x \mathrm{~d} t+\right. \\
\left.+\int_{Q_{0}} u^{2}(T, x)(\varrho(x)-\delta) \mathrm{d} x\right\}=\lim _{\delta \rightarrow 0^{+}}\left[-\iint_{D} \sum_{i, j=1}^{n}\left(a_{i j} u_{x_{i}} \varrho_{x_{j}} u^{2}\right)_{x_{i}} \mathrm{~d} x \mathrm{~d} t-\right.
\end{gathered}
$$

$$
\begin{gathered}
\left.-\iint_{D_{\delta}}\left(u^{2}\right)_{t}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t+\int_{Q_{\delta}} u^{2}(T, x)(\varrho(x)-\delta) \mathrm{d} x\right]= \\
=\lim _{\delta \rightarrow 0^{+}}\left[\int_{\delta}^{T} \int_{a} u_{Q_{\delta}}^{2}(t, x) K(t, x) \mathrm{d} S \mathrm{~d} t+\int_{Q_{\delta}} u^{2}(\delta, x)(\varrho(x)-\delta) \mathrm{d} x\right]= \\
=\lim _{\delta \rightarrow 0^{+}}\left[\int_{0}^{T} \int_{\partial_{Q}} u^{2}\left(t, x_{\delta}(x)\right) K(t, x) \mathrm{d} S \mathrm{~d} t+\int_{Q} u^{2}(\delta, x) \varrho(x) \mathrm{d} x+\right. \\
+\int_{\delta}^{T} \int_{\partial_{Q}} u^{2}\left(t, x_{\delta}(x)\right)\left[K\left(t, x_{\delta}(x)\right)-K(t, x)\right] \mathrm{d} x \mathrm{~d} t-\int_{Q-Q_{\delta}} u^{2}(\delta, x) \varrho(x) \mathrm{d} x- \\
\left.-\delta \int_{Q_{d}} u^{2}(\delta, x) \mathrm{d} x-\int_{0}^{\delta} \int_{\partial_{Q}} u^{2}\left(t, x_{\delta}(x)\right) K(t, x) \mathrm{d} S \mathrm{~d} t\right]=\lim _{\delta \rightarrow 0^{+}}\left(\left\|u_{\delta}\right\|_{2}^{1}\right)^{2}
\end{gathered}
$$

because the four last terms tend to zero as $\delta \rightarrow 0^{+}$. So we proved (31).
It follows from assumptions (B) and (C) that

$$
\begin{gather*}
\left|\iint_{D_{-D_{s}}} \psi\left(u\left(t^{\delta}, x^{\delta}\right)\right) \mathrm{d} x \mathrm{~d} t\right| \leqslant C_{16} \iint_{D_{-D_{s}}}\left[\left|u_{x}\right|\left|u_{x}\left(t^{\delta}, x^{\delta}\right)\right| \varrho+|u|\left|u\left(t^{\delta}, x^{\delta}\right)\right|+\right.  \tag{33}\\
+|u|\left|u_{x}\left(t^{\delta}, x^{\delta}\right)\right|+f\left|u\left(t^{\delta}, x^{\delta}\right)\right| \varrho+|u|\left|u\left(t^{\delta}, x^{\delta}\right)\right| \varrho+\left|u_{x}\right|\left|u\left(t^{\delta}, x^{\delta}\right)\right| \varrho+ \\
\left.+|u|\left|u_{t}\left(t^{\delta}, x^{\delta}\right)\right| \varrho\right] \mathrm{d} x \mathrm{~d} t
\end{gather*}
$$

for some positive constant $C_{16}$ independent of $\delta$. Let us denote the integrals on right respectively by $P_{1}, P_{2}, \ldots, P_{7}$.

Since $\varrho\left(x^{\delta}(x)\right) \geqslant \varrho(x)$ for $x \in Q$ we have

$$
P_{1}^{2}(\delta) \leqslant \iint_{D-D_{\delta}} u_{x}^{2} \varrho \mathrm{~d} x \mathrm{~d} t \iint_{D-D_{s}} u_{x}^{2}\left(t^{\delta}, x^{\delta}\right) \varrho\left(x^{\delta}\right) \mathrm{d} x \mathrm{~d} t
$$

thus from condition II and Lemma 4 we get that $\lim P_{1}(\delta)=0$.

$$
\delta \rightarrow 0^{+} .
$$

Condition (11) implies $u \in L^{2}(D)$ thus quite similarly as above we obtain that $\lim P_{2}(\delta)=0$ and since $P_{5}(\delta) \leqslant \sup \varrho(x) P_{2}(\delta), \quad \lim P_{5}(\delta)=0$, too.

$$
\delta \rightarrow 0^{+}
$$

$$
x \in Q \quad \delta \rightarrow 0^{+}
$$

We have the following estimation
by Theorem 2 and conditions (3) and (21) of Lemma 1.

$$
\begin{align*}
& \iint_{D-D_{0}} u^{2} \mathrm{~d} x \mathrm{~d} t=\int_{0}^{T} \int_{\mathbf{Q}-\mathbf{Q}_{\delta}} u^{2} \mathrm{~d} x \mathrm{~d} t+\int_{0}^{\delta} \int_{\mathbf{Q}_{\delta}} u^{2} \mathrm{~d} x \mathrm{~d} t= \\
& =\int_{0}^{\boldsymbol{T}} \mathrm{d} t \int_{0}^{\delta} \mathrm{d} s \int_{\mathbf{Q}_{s}} u^{2}(t, x) \mathrm{d} S \mathrm{~d} t+\int_{0}^{\delta} \mathrm{d} t \int_{Q_{\delta}} u^{2}(t, x) \mathrm{d} x \leqslant \\
& \leqslant \delta \sup _{s \in\{0, \delta]} \int_{0}^{T} \int_{Q_{S}} u^{2}(t, x) \mathrm{d} S \mathrm{~d} t+\delta \sup _{t \in(0, \delta]} \int_{Q_{0}} u^{2}(t, x) \mathrm{d} x \leqslant  \tag{34}\\
& \leqslant \delta\left[\sup _{s \in(0, \delta 1} \int_{0}^{T} \int_{Q_{s}} u^{2}(t, x) \mathrm{d} S \mathrm{~d} t+\sup _{t \in(0, \delta]} \int_{Q_{t}} u^{2}(t, x) \mathrm{d} x\right]
\end{align*}
$$

Since $\varrho\left(x^{\delta}(x)\right) \geqslant \frac{\delta}{2}$ we have

$$
P_{3}(\delta) \leqslant \iint_{\bar{D}-D_{0}}\left|u_{x}\left(t^{\delta}, x^{\delta}\right)\right| \varrho^{\frac{1}{2}}\left(x^{\delta}(x)\right) \frac{|u|}{\sqrt{\delta}} \sqrt{2} \mathrm{~d} x \mathrm{~d} t
$$

thus by Hölder's inequality we get

$$
P_{3}^{2}(\delta) \leqslant \iint_{D-D_{d}} u_{x}^{2}\left(t^{\delta}, x^{\delta}\right) \varrho\left(x^{\delta}(x)\right) \mathrm{d} x \mathrm{~d} t \frac{2}{\delta} \iint_{D-D_{s}} u^{2}(t, x) \mathrm{d} x \mathrm{~d} t
$$

so $\lim P_{3}(\delta)=0$ by (34) and Lemma 4. Using Hölder's inequality we ${ }^{\boldsymbol{b}} \mathrm{O}^{+}$
have

$$
P^{2}(\delta) \leqslant \iint_{D-D_{0}} \frac{u^{2}\left(t^{\delta}, x^{\delta}\right)}{\varrho(x)^{\theta-2}} \mathrm{~d} x \mathrm{~d} t \iint_{D-D_{s}} f^{2} \varrho^{\theta} \mathrm{d} x \mathrm{~d} t
$$

thus $\lim P_{4}(\delta)=0$ by assumption (C), and Lemma 4.
${ }^{8} \rightarrow 0^{+}$
In the same way we get

$$
P_{6}^{2}(\delta) \leqslant \iint_{D-D_{b}} \varrho u_{x}^{2} \mathrm{~d} x \mathrm{~d} t \iint_{D-D_{\theta}} u^{2}\left(t^{\delta}, x^{\delta}\right) \mathrm{d} x \mathrm{~d} t \sup _{x \in Q} \varrho(x)
$$

thus $\lim P_{6}(\delta)=0$ by Lemma 4 and condition II.
$\delta \rightarrow 0^{+}$
Since $t^{\delta} \geqslant \frac{\delta}{2}$ we get

$$
\begin{aligned}
P_{7}^{2}(\delta) & \leqslant\left[\iint_{D-D_{\delta}}\left|u_{t}\left(t^{\delta}, x^{\delta}\right)\right|\left(t^{\delta}\right)^{\frac{\beta}{2}}|u| \mathrm{d} x \mathrm{~d} t \sup _{x \in Q} \varrho(x)\right]^{2}\left(\frac{2}{\delta}\right)^{R} \leqslant \\
& \leqslant\left(\sup _{x \in Q} \varrho(x)\right)_{D_{-D_{\delta}}}^{\int} \int_{t} u_{t}^{2}\left(t^{\delta}, x^{\delta}\right)\left(t^{\delta}\right)^{\beta} \mathrm{d} x \mathrm{dt}\left(\frac{2}{\delta}\right)^{\frac{\beta}{2}} \iint_{D-D_{\delta}} u^{2} \mathrm{~d} x \mathrm{~d} t
\end{aligned}
$$

and hence $\lim _{\delta \rightarrow 0^{+}} P_{7}(\delta)=0$ by Lemma 4, assumption of this theorem and condition (34), as $1-\frac{\beta}{2}>0$. Thus we proved the condition (29).

Condition (30) follows from the estimation

$$
\begin{aligned}
& {\left[\int_{Q-Q_{\delta}} u(T, x) u\left(T, x^{\delta}(x)\right) \varrho(x) \mathrm{d} x\right]^{2} \leqslant} \\
& \leqslant\left(\sup _{x \in Q} \varrho(x)\right)_{Q-Q_{\delta}} u^{2} \int^{2}(T, x) \mathrm{d} x \cdot \gamma_{2} \int_{Q_{\frac{\delta}{2}}-Q_{\delta}} u^{2}(T, x) \mathrm{d} x
\end{aligned}
$$

and the fact that $u(T, \cdot) \in L^{2}(Q)$. This completes the proof of Theorem 4.
In the case $p>2$ we begin with the following result.

LEMMA 5. Let $u$ be a weak solution of (1) satisfying one of conditions I or II for a fixed $p>2$ and $\iint u_{t}^{2}\left(\mid u^{p-2}+1\right) t^{\beta} \mathrm{d} x \mathrm{~d} t<\infty$ for some $\beta<1$. Then $u_{\delta}$ converges to $\varphi$ in ${ }^{D} q(\partial D)$ for each $q$, where $0<q<p$. The function $\varphi$ is defined in Theorem 2.

Proof. First we note that $u_{\delta}$ converges weakly to $\varphi$ in $L^{p}(\partial D)$ by Theorem 2. We shall show that $u_{\delta}$ converges to $\varphi$ in $\bar{L}^{2}(\partial D)$.

Let $\alpha(\Theta)=0$ for $p \leqslant \Theta<\frac{3}{2} p, \alpha(\Theta)=\frac{\Theta-1-p}{p}$ for $\frac{3}{2} \leqslant \Theta<2 p-1$ and $\chi(\Theta)=\frac{2}{p} \Theta-a(\Theta)$. For $\Theta$ and $\chi$ such that $p \leqslant \Theta<2 p-1$ and $2 \leqslant$ $\leqslant \chi<3$ we have

$$
\iint_{D} f^{2} \varrho^{x} \mathrm{~d} x \mathrm{~d} t \leqslant\left[\iint_{D} f^{p} \varrho^{\theta} \mathrm{d} x \mathrm{~d} t\right]_{p}^{2}\left[\iint_{D} \varrho^{-\frac{p^{x}}{p-2}} \mathrm{~d} x \mathrm{~d} t\right]^{p-2}<\infty
$$

by assumption (C) as $\frac{p a}{p-2}<1$.
Since $W_{\text {ioc }}^{1,1}(D) \subset W_{\text {loc }}^{1,1}(D), u$ is a weak solution of (1) for $p=2$. By Lemma 2, condition II is fulfilied with $p=2$. Thus we can use the result of Theorem 4. Hence $u_{\delta}$ converges to some function $\bar{\varphi}$ in $L(\partial D)$ so $\varphi=\bar{\varphi}$ a.e.
$\varphi=\bar{\varphi}$ a.e.
For measurable sets $A \subset \partial D$ and $s$ satisfying $\frac{1}{s}+\frac{q}{p}=1$ we have

$$
\begin{gathered}
\left.\left.\int_{A}\left|u_{\delta}-\varphi\right|^{q} \leqslant|A|^{s}\left[\int_{A}\left|u_{\delta}-\varphi\right|^{p}\right]^{\frac{q}{p}} \leqslant|A|^{s} \right\rvert\,\left[\int_{\partial D}\left|u_{\delta}\right|^{p}\right]^{\frac{1}{p}}+\left[\int_{\partial D} \mid \varphi^{p}\right]^{p}\right\}\left.^{\frac{1}{p}}\right|^{q} \leqslant \\
\leqslant|A|^{s}\left(\left\|u_{\delta}\right\|_{p}+\|\varphi\|_{p}\right)^{q} .
\end{gathered}
$$

Thus $u_{\delta}-\varphi$ is equi-absolutely integrable and bounded in $\bar{L} q(\partial D)$ so it is compact for $\delta$ such that $0<\delta \leqslant \delta_{0}$. Now for any sequence $\delta_{k} \rightarrow 0$ there is a subsequence $\delta_{k}^{1} \rightarrow 0^{+}$with $u_{\delta_{k}^{1}}-\varphi \rightarrow 0$ a.e. and the result follows.

To prove $\bar{L}^{p}$-convergence we shall need the following theorem on Nemytsky Operators (see [10], p. 155).

THEOREM. If $f(t, x, u)$, defined on $\partial D \times R$, satisfies Carathéodory conditions, conditions (i) and (ii) of assumption (C) and

$$
|f(t, x, u)| \leqslant g(t, x)+K|u|^{\frac{s}{t}},
$$

where $g \in \bar{L}^{t}(\partial D), 1 \leqslant s, t<\infty$ and $K$ is a positive constant, then $f$ generates a continuous operator from $L^{s}(\partial D)$ into $L^{t}(\partial D)$ given by the formula

$$
h: u(\cdot, \cdot) \rightarrow f(\cdot, \cdot, u(\cdot, \cdot))
$$

This operator is called the Nemytsky Operator.
We now establish the following $L^{p}$-convergence theorem.

THEOREM 5. Let $u$ be a weak solution of (1) satisfying one of conditions I or II for fixed $p>2, \iint_{D}\left(u_{t}^{2}\left(|u|^{p-2}+1\right) t^{\beta} \mathrm{d} x \mathrm{~d}\right.$ for some $\beta<1$, then $u_{\delta}$ converges to the function $\varphi$ in $L^{p}(\partial D)$.

Proof. Let us denote by $u^{\delta}$ the trace of the composition $u\left(t^{\delta}(t)\right.$, $\left.x^{\delta}(x)\right)$ on $\partial D$. It is clear that $u^{\delta}=u_{\frac{\delta}{2}}$ for $\delta \in\left(0, \delta_{0}\right]$.

We begin with the following
REMARK. If $u^{\delta}$ is bounded in $L^{p}(\partial D)$ and $u^{\delta} \rightarrow \varphi$ in $L a(\partial D)$ for $q<p$ then $u^{\delta}\left|u^{\delta}\right|^{p-2} \rightarrow \varphi|\varphi|^{p-2}$ weakly in $\bar{L}^{\frac{p}{p-1}}(\partial D)$. This means that the mapping given by the formula

$$
f\left(t, x, u^{\delta}\right)=u^{\delta}\left|u^{\delta}\right| p-2
$$

is continuous from $L^{q}(\partial D)$ to $L^{\frac{p-1}{q}}(\partial D)$ by Theorem on Nemytsky Operators.

Hence

$$
u^{\delta}\left|u^{\delta}\right|^{p-2} \rightarrow \varphi|\varphi|^{p-2} \text { as } \delta \rightarrow 0^{+}
$$

in $\bar{L}^{\frac{q}{p-1}}(\partial D)$, where we take $\frac{q}{p-1}>1$. Also $u^{s} \mid u^{\delta \mid p-2}$ is bounded in $L^{\frac{p}{p-1}}(\partial D)$ and so it is weakly compact and the result follows.

The rest of the proof is similar to that of Theorem 4. For every $g \in W_{\frac{p}{p-1}}^{1,1}(D)$ we get

$$
\begin{aligned}
& \int_{0}^{T} \int_{\partial Q} g K \mathrm{~d} S \mathrm{~d} t+\int_{Q} \varphi(0, x) g(0, x) \varrho(x) \mathrm{d} x= \\
& =\iint_{D} \psi(g) \mathrm{d} x \mathrm{~d} t+\int_{Q} u(T, x) g(T, x) \varrho(x) \mathrm{d} x
\end{aligned}
$$

since $u^{\delta} \rightarrow \varphi$ as $\delta \rightarrow 0^{+}$weakly in $\bar{L}^{p}(\partial D)$ (see the proof of Lemma 3).
Set $g=u\left(t^{\delta}, x^{\delta}\right)\left|u\left(t^{\delta}, x^{\delta}\right)\right|^{p-2}$ in the above equality and noting that $u\left(t^{s}, x^{\delta}\right)=u \quad$ on $D_{\delta}$ and $u^{\delta}\left|u^{\delta}\right|^{p-2} \rightarrow \varphi|\varphi|^{p-2}$ weakly in $\tilde{L}^{\frac{p}{p-1}}(\partial D)$ we obtain

$$
\begin{gather*}
\left(\|\varphi\|_{p}^{1}\right)^{p}=\lim _{\delta \rightarrow 0^{+}}\left[\int_{0}^{T} \int_{a_{Q}} \varphi u^{\delta} \mid u^{\delta \mid p-2} K \mathrm{~d} S \mathrm{~d} t+\right. \\
+\int_{Q} \varphi(0, x) u^{\delta}(0, x)\left|u^{\delta}(0, x)\right|^{p-2} \varrho(x) \mathrm{d} x=\lim _{\delta \rightarrow 0^{+}}\left[\iint_{D_{\delta}} \psi\left(u|u|^{p-2}\right) \mathrm{d} x \mathrm{~d} t+\right. \\
\left.+\int_{Q_{0}}|u(T, x)|^{p} \varrho(x) \mathrm{d} x\right]+\lim _{\delta \rightarrow 0^{+}}\left[\iint_{D-D_{\delta}} \psi\left(u\left(t^{\delta}, x^{j}\right)\left|u\left(t^{\delta}, x^{\delta}\right)\right|^{p-2}\right) \mathrm{d} x \mathrm{~d} t+\right.  \tag{36}\\
+\int_{Q-Q_{\delta}} u(T, x) u\left(T, x^{\delta}(x)\right)\left|u\left(T, x^{\delta}(x)\right)\right|^{p-2} \varrho(x) \mathrm{d} x
\end{gather*}
$$

Setting
in (2) we obtain

$$
v= \begin{cases}u|u|^{p-2}(\varrho-\delta), & \text { for }(t, x) \in D_{8} \\ 0, & \text { for }(t, x) \in D-D_{z}\end{cases}
$$

$$
\begin{gathered}
\iint_{D_{i}} \sum_{i, j=1}^{n} a_{i j} u_{x_{i}}\left(u|u|^{p-2}\right)_{x_{j}}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t+\iint_{D_{i}} \sum_{i, j=1}^{n} a_{i j} u_{x_{i}} u|u|^{p-2} \varrho_{x_{j}} \mathrm{~d} x \mathrm{~d} t+ \\
\quad+\iint_{D_{i}} b u|u|^{p-2}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t+\iint_{D_{i}} u_{t} u|u| p-2(\varrho-\delta) \mathrm{d} x \mathrm{~d} t=0 .
\end{gathered}
$$

As in the proof of Theorem 4 it is obvious that
thus

$$
\begin{gathered}
\lim _{\delta \rightarrow 0^{+}} \delta \iint_{D_{0}}\left[\sum_{i, j=1}^{n} a_{i j} u_{x_{i}}\left(u|u|^{p-2}\right)_{x_{j}}+b u|u|^{p-2}+u_{t} u|u| p-2\right] \mathrm{d} x \mathrm{~d} t+ \\
+\delta \int_{Q_{j}}|u(T, x)|^{p} \mathrm{~d} x=0
\end{gathered}
$$

$$
\begin{aligned}
& \lim _{0 \rightarrow 0^{+}}\left[\iint_{D_{0}} \psi\left(u|u|^{p-2}\right) \mathrm{d} x \mathrm{~d} t+\int_{Q_{0}}|u(T, x)|^{p} \varrho(x) \mathrm{d} x\right]= \\
& =\lim _{\delta \rightarrow 0^{+}}\left[-\iint_{D_{s}} \sum_{i, j=1}^{n}\left(a_{i j} \varrho_{x,} u|u|^{p}\right)_{x_{1}} \mathrm{~d} x \mathrm{~d} t-\iint_{D_{\delta}}(|u| p)_{t}(\varrho-\delta) \mathrm{d} x \mathrm{~d} t+\right. \\
& \left.+\int_{Q_{\delta}} \mid u(T, x)^{p}(\varrho(x)-\delta) \mathrm{d} x\right]=\lim _{\delta \rightarrow 0^{+}}\left[\int_{\partial}^{T} \int_{\partial Q_{0}}|u| p K \mathrm{dSd} t+\right. \\
& +\int_{Q_{\delta}}|u(\delta, x)|^{p}(\varrho(x)-\delta) \mathrm{d} x=\lim _{\delta \rightarrow 0^{+}}\left(\left\|u_{\partial}\right\|_{p}^{1}\right)^{p} .
\end{aligned}
$$

Thus, it suffices to show that second component on the right of (36) tends to zero as $\delta \rightarrow 0^{+}$. It is easily seen that this integrand can be estimated by

$$
\begin{aligned}
& \quad K\left(\left|u_{x}\right|\left|u_{x}(\delta)\right||u(\delta)|^{p-2} \varrho+|u||u(\delta)|^{p-1}+|u|\left|u_{x}(\delta)\right||u(\delta)|^{p-2}+\right. \\
& +f|u(\delta)|^{p-1} \varrho+|u||u(\delta)|^{p-1} \varrho+\left|u_{x}\right||u(\delta)|^{p-1} \varrho+|u|\left|u_{t}(\delta)\right||u(\delta)|^{p-2}
\end{aligned}
$$

where $K$ is a suitable constant and we denote $u(\delta)=u\left(t^{\delta}, x^{\delta}\right)$.
Estimation of the integrals of the first, second, fourth, fifth and sixth terms is similar to the previous calculations (see the proof of Theorem 4).

We have the following inequality

$$
a b c^{p-2} \leqslant \mathrm{const}\left(a^{p}+b^{2} c^{p-2}+c^{p}\right)
$$

for each positive $a, b, c$ and $p>2$.
Set $a=|u|, b=\left|u_{x}(\delta)\right|$ or $b=\left|u_{t}(\delta)\right|$ and $c=|u(\delta)|$. Now we can estimate the third and seventh terms analogously as in the proof of Theorem 4. This completes the proof of Theorem 5.
